Introduction to Compilers Radu Rugina

Lecture 8: Bottom-up Parsing
6 Feb 02

Shift-reduce Parsing

- **Parsing actions:** is a sequence of **shift** and **reduce** operations
- **Parser state:** a stack of terminals and non-terminals (grows to the right)
- Current derivation step = always stack+input

| Derivation step | stack | unconsumed input |
|----------------------------|-------|------------------|
| $(1+2+(3+4))+5 \leftarrow$ | | $(1+2+(3+4))+5$ |
| $(E+2+(3+4))+5 \leftarrow$ | (E | $+2+(3+4))+5$ |
| $(S+2+(3+4))+5 \leftarrow$ | (S | $+2+(3+4))+5$ |
| $(S+E+(3+4))+5 \leftarrow$ | (S+E | $+(3+4))+5$ |

CS 412/413 Spring 2002

Introduction to Compilers

2

Shift-reduce Actions

- Parsing is a sequence of shifts and reduces
- **Shift :** move look-ahead token to stack
- **Reduce :** Replace symbols γ from top of stack with non-terminal symbol X , corresponding to production $X \rightarrow \gamma$ (pop γ , push X)

| stack | input | action |
|-------|----------------|---------|
| (| $1+2+(3+4))+5$ | shift 1 |
| (1 | $+2+(3+4))+5$ | |

| stack | input | action |
|-------|-------------|----------------------------|
| (S+E | $+(3+4))+5$ | reduce $S \rightarrow S+E$ |
| (S | $+(3+4))+5$ | |

CS 412/413 Spring 2002

Introduction to Compilers

3

Shift-reduce Parsing

$S \rightarrow S + E \mid E$
 $E \rightarrow \text{num} \mid (S)$

| derivation | stack | input stream | action |
|----------------------------|-------|-----------------|-----------------------------------|
| $(1+2+(3+4))+5 \leftarrow$ | | $(1+2+(3+4))+5$ | shift |
| $(1+2+(3+4))+5 \leftarrow$ | (| $1+2+(3+4))+5$ | shift |
| $(1+2+(3+4))+5 \leftarrow$ | (1 | $+2+(3+4))+5$ | reduce $E \rightarrow \text{num}$ |
| $(E+2+(3+4))+5 \leftarrow$ | (E | $+2+(3+4))+5$ | reduce $S \rightarrow E$ |
| $(S+2+(3+4))+5 \leftarrow$ | (S | $+2+(3+4))+5$ | shift |
| $(S+2+(3+4))+5 \leftarrow$ | (S+ | $2+(3+4))+5$ | shift |
| $(S+2+(3+4))+5 \leftarrow$ | (S+2 | $+(3+4))+5$ | reduce $E \rightarrow \text{num}$ |
| $(S+E+(3+4))+5 \leftarrow$ | (S+E | $+(3+4))+5$ | reduce $S \rightarrow S+E$ |
| $(S+(3+4))+5 \leftarrow$ | (S | $+(3+4))+5$ | shift |
| $(S+(3+4))+5 \leftarrow$ | (S+ | $(3+4))+5$ | shift |
| $(S+(3+4))+5 \leftarrow$ | (S+(| $3+4))+5$ | shift |
| $(S+(3+4))+5 \leftarrow$ | (S+(3 | $+4))+5$ | reduce $E \rightarrow \text{num}$ |

Introduction to Compilers

4

LR Parsing Engine

- **Basic mechanism:**
 - Use a set of **parser states**
 - Use a **stack with alternating symbols and states**
 - E.g: $1 (6 S_{10} + 5$
 - Use a **parsing table** to:
 - Determine what action to apply (shift/reduce)
 - Determine the next state
- The parser actions can be precisely determined from the table

CS 412/413 Spring 2002

Introduction to Compilers

5

The LR Parsing Table

| | Terminals | Non-terminals |
|-------|----------------------------|---------------|
| State | Next action and next state | Next state |
| | Action table | Goto table |

- **Algorithm :** look at entry for current state S and input terminal C
 - If $\text{Table}[S,C] = s(S)$ then **shift:**
 $\text{push}(C), \text{push}(S')$
 - If $\text{Table}[S,C] = X \rightarrow \alpha$ then **reduce:**
 $\text{pop}(2*|\alpha|), S' = \text{top}(), \text{push}(X), \text{push}(\text{Table}[S',X])$

CS 412/413 Spring 2002

Introduction to Compilers

6

LR Parsing Table Example

| | (|) | id | , | \$ | S | L |
|---|-------|-------|-------|-------|--------|----|----|
| 1 | s3 | s2 | | | | g4 | |
| 2 | S→id | S→id | S→id | S→id | S→id | | |
| 3 | s3 | s2 | | | | g7 | g5 |
| 4 | | | | | accept | | |
| 5 | | s6 | | s8 | | | |
| 6 | S→(L | S→(L | S→(L | S→(L | S→(L | | |
| 7 | L→S | L→S | L→S | L→S | L→S | | |
| 8 | s3 | s2 | | | | g9 | |
| 9 | L→L,S | L→L,S | L→L,S | L→L,S | L→L,S | | |

CS 412/413 Spring 2002

Introduction to Compilers

7

LR(k) Grammars

- **LR(k)** = Left-to-right scanning, Right-most derivation, k look-ahead characters
- Main cases: LR(0), LR(1), and some variations (SLR and LALR(1))
- Parsers for **LR(0)** Grammars:
 - Determine the actions without any lookahead symbol
 - will help us understand shift-reduce parsing

CS 412/413 Spring 2002

Introduction to Compilers

8

Building LR(0) Parsing Tables

- To build the **parsing table**:
 - Define states of the parser
 - Build a DFA to describe the transitions between states
 - Use the DFA to build the parsing table
- Each **LR(0) state** is a set of **LR(0) items**:
 - An LR(0) item: $X \rightarrow \alpha \cdot \beta$, where $X \rightarrow \alpha \beta$ is a production in the grammar
 - The LR(0) items keep track of the progress on all of the possible upcoming productions
 - The item $X \rightarrow \alpha \cdot \beta$ abstracts the fact that the parser already matched the string α at the top of the stack

CS 412/413 Spring 2002

Introduction to Compilers

9

Example LR(0) State

- An LR(0) item is a production from the language with a separator "." somewhere in the RHS of the production

- Sub-string before "." is already on stack (beginnings of possible γ 's to be reduced)
- Sub-string after "." : what we might see next

CS 412/413 Spring 2002

Introduction to Compilers

10

LR(0) Grammar

- Nested lists:

$$S \rightarrow (L) \mid id$$

$$L \rightarrow S \mid L, S$$

- Examples

- (a, b, c)
- ((a,b), (c,d), (e,f))
- (a, (b,c,d), ((f,g)))

Parse tree for (a, (b,c), d)

CS 412/413 Spring 2002

Introduction to Compilers

11

Start State & Closure

- **Start state**
 - Augment grammar with production $S' \rightarrow S \$$
 - Start state of DFA has empty stack: $S' \rightarrow \cdot S \$$
- **Closure of a parser state**:
 - Start with $\text{Closure}(S) = S$
 - Then for each item in S :

$$X \rightarrow \alpha \cdot Y \beta$$
 add the items for all the productions $Y \rightarrow \gamma$ to the closure of S :

$$Y \rightarrow \cdot \gamma$$

CS 412/413 Spring 2002

Introduction to Compilers

12

Closure Example

$S \rightarrow (L) \mid id$
 $L \rightarrow S \mid L, S$

DFA start state

$S' \rightarrow \cdot S \$$

closure

$S' \rightarrow \cdot S \$$
 $S \rightarrow \cdot (L)$
 $S \rightarrow \cdot id$

- set of possible productions to be reduced next
- Added items have the "." located at the beginning; no symbols for these items on the stack yet

CS 412/413 Spring 2002

Introduction to Compilers

13

The Goto Operation

- **Goto operation** = describes transitions between parser states, which are sets of items
- **Algorithm:** for a state S and a symbol Y
 - $S' = \{X \rightarrow \alpha Y \cdot \beta \mid X \rightarrow \alpha \cdot Y \beta \in S\}$
 - $Goto(S, X) = Closure(S')$

$S' \rightarrow \cdot S \$$
 $S \rightarrow \cdot (L)$
 $S \rightarrow \cdot id$

Goto($S, '('$)

Closure($\{S \rightarrow \cdot (L)\}$)

CS 412/413 Spring 2002

Introduction to Compilers

14

Goto: Terminal Symbols

Grammar:

$S \rightarrow (L) \mid id$
 $L \rightarrow S \mid L, S$

In new state, include all items that have appropriate input symbol just after dot, advance dot in those items, and take closure.

CS 412/413 Spring 2002

Introduction to Compilers

15

Goto: Non-terminal Symbols

(same algorithm for transitions on non-terminals)

CS 412/413 Spring 2002

Introduction to Compilers

16

Applying Reduce Actions

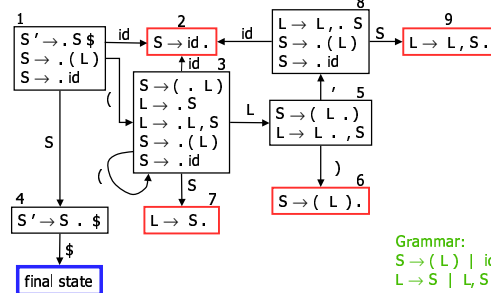

- Pop RHS off stack, replace with LHS X ($X \rightarrow \gamma$), then rerun DFA (e.g. (x))

CS 412/413 Spring 2002

Introduction to Compilers

17

Full DFA (Appel p. 63)

CS 412/413 Spring 2002

Introduction to Compilers

18

Parsing Example: ((a),b)

$S \rightarrow (L) \mid id$
 $L \rightarrow S \mid L, S$

| derivation | stack | input | action |
|------------|--|---------|---------------|
| ((a),b) ← | 1 | ((a),b) | shift, goto 3 |
| ((a),b) ← | 1 (3 | (a),b) | shift, goto 3 |
| ((a),b) ← | 1 (3 (3 | a),b) | shift, goto 2 |
| ((a),b) ← | 1 (3 (3 a ₂ |),b) | reduce S→id |
| ((S),b) ← | 1 (3 (3 S ₇ |),b) | reduce L→S |
| ((L),b) ← | 1 (3 (3 S ₇ |),b) | shift, goto 6 |
| ((L),b) ← | 1 (3 (3 L ₅ |),b) | reduce S→(L) |
| (S,b) ← | 1 (3 S ₇ |),b) | reduce L→S |
| (L,b) ← | 1 (3 L ₅ |),b) | shift, goto 8 |
| (L,b) ← | 1 (3 L ₅ , 8 | b) | shift, goto 9 |
| (L,b) ← | 1 (3 L ₅ , 8 b ₂ |) | reduce S→id |
| (L,S) ← | 1 (3 L ₅ , 8 S ₉ |) | reduce L→L, S |
| (L) ← | 1 (3 L ₅ |) | shift, goto 6 |
| (L) ← | 1 (3 L ₅) ₆ |) | reduce S→(L) |
| S | 1 S ₄ | \$ | done |

CS 412/413 Spring 2002 Introduction to Compilers 19

Reductions

- On reducing $X \rightarrow \gamma$ with stack $\alpha\gamma$:
 - pop γ off stack, revealing prefix α and state
 - take single step in DFA from top state
 - push X onto stack with new DFA state
- Example:

| | | | |
|-----------|------------------------|-------|---------------|
| ((a),b) ← | 1 (3 (3 | a),b) | shift, goto 2 |
| ((a),b) ← | 1 (3 (3 a ₂ |),b) | reduce S→id |
| ((S),b) ← | 1 (3 (3 S ₇ |),b) | reduce L→S |

CS 412/413 Spring 2002 Introduction to Compilers 20

Build the Parsing Table

- States in the table = states in the DFA
- For a transition $S \rightarrow S'$ on terminal C:

$$\text{Shift}(S') \subseteq \text{Table}[S,C]$$
- For a transition $S \rightarrow S'$ on non-terminal N:

$$\text{Goto}(S') \subseteq \text{Table}[S,N]$$
- If S is a reduction state $X \rightarrow \gamma$ then:

$$\text{Reduce}(X \rightarrow \gamma) \subseteq \text{Table}[S,*]$$

CS 412/413 Spring 2002 Introduction to Compilers 21

Computed LR Parsing Table

| | (|) | id | , | \$ | S | L |
|---|-------|-------|-------|-------|--------|----|----|
| 1 | s3 | | s2 | | | g4 | |
| 2 | S→id | S→id | S→id | S→id | S→id | | |
| 3 | s3 | | s2 | | | g7 | g5 |
| 4 | | | | | accept | | |
| 5 | | s6 | | s8 | | | |
| 6 | S→(L) | S→(L) | S→(L) | S→(L) | S→(L) | | |
| 7 | L→S | L→S | L→S | L→S | L→S | | |
| 8 | s3 | | s2 | | | g9 | |
| 9 | L→L,S | L→L,S | L→L,S | L→L,S | L→L,S | | |

CS 412/413 Spring 2002 Introduction to Compilers 22

LR(0) Summary

- LR(0) parsing recipe:
 - Start with an LR(0) grammar
 - Compute LR(0) states and build DFA:
 - Use the closure operation to compute states
 - Use the goto operation to compute transitions between states
 - Build the LR(0) parsing table from the DFA
- This process can be automated, i.e. we can build parser generator tools

CS 412/413 Spring 2002 Introduction to Compilers 23

LR(0) Limitations

- An LR(0) machine only works if states with reduce actions have a **single** reduce action -- in those states, **always** reduce ignoring lookahead
- With more complex grammar, construction gives states with shift/reduce or reduce/reduce conflicts
- Need to use look-ahead to choose

| | | |
|----------------------------|--|---|
| ok | shift / reduce | reduce / reduce |
| $L \rightarrow L, S \cdot$ | $L \rightarrow L, S \cdot$ $S \rightarrow S \cdot, L$ | $L \rightarrow S, L \cdot$ $L \rightarrow S \cdot$ |

CS 412/413 Spring 2002 Introduction to Compilers 24

LR(0) Parsing Table

| | (|) | id | , | \$ | S | L |
|---|-------|-------|-------|-------|-------|----|--------|
| 1 | s3 | s2 | | | | g4 | |

25

A Non-LR(0) Grammar

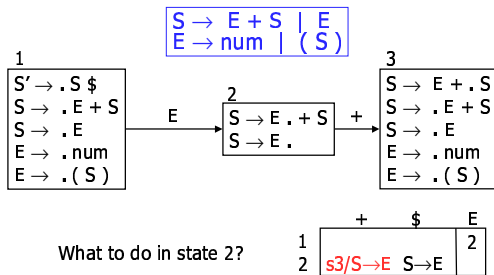

- Grammar for addition of numbers:
 $S \rightarrow S + E \mid E$
 $E \rightarrow \text{num} \mid (S)$
- Left-associative is LR(0)
- Right-associative version is not LR(0)
 $S \rightarrow E + S \mid E$
 $E \rightarrow \text{num} \mid (S)$

LR(0) Parsing Table

CS 412/413 Spring 2002

Introduction to Compilers

27

Next Time

- Learn about other kinds of LR parsing:
 - SLR = improved LR(0)
 - LR(1) = 1 character lookahead
 - LALR(1) = Look-Ahead LR(1)
- Basic ideas are the same as for LR(0)
 - Parser states with LR items
 - DFA with transitions between parser states
 - Parser table with shift/reduce/goto actions
