

## GProf Sample

---

This is the output from gprof on the Dec Alpha from an AOLServer 2.2.1 run where index.html was fetched 53,623 times.

```

call graph profile:
    The sum of self and descendents is the major sort
    for this listing.

    function entries:

index    the index of the function in the call graph
         listing, as an aid to locating it (see below).

%time    the percentage of the total time of the program
         accounted for by this function and its
         descendents.

self     the number of seconds spent in this function
         itself.

descendents
         the number of seconds spent in the descendents of
         this function on behalf of this function.

called   the number of times this function is called (other
         than recursive calls).

self     the number of times this function calls itself
         recursively.

name     the name of the function, with an indication of
         its membership in a cycle, if any.

index    the index of the function in the call graph
         listing, as an aid to locating it.

         parent listings:

self*    the number of seconds of this function's self time
         which is due to calls from this parent.

descendents*
         the number of seconds of this function's
         descendent time which is due to calls from this
         parent.

called**  the number of times this function is called by
         this parent. This is the numerator of the
         fraction which divides up the function's time to
         its parents.

total*   the number of times this function was called by
         all of its parents. This is the denominator of
         the propagation fraction.

```

parents the name of this parent, with an indication of the parent's membership in a cycle, if any.

index the index of this parent in the call graph listing, as an aid in locating it.

children listings:

self\* the number of seconds of this child's self time which is due to being called by this function.

descendent\* the number of seconds of this child's descendent's time which is due to being called by this function.

called\*\* the number of times this child is called by this function. This is the numerator of the propagation fraction for this child.

total\* the number of times this child is called by all functions. This is the denominator of the propagation fraction.

children the name of this child, and an indication of its membership in a cycle, if any.

index the index of this child in the call graph listing, as an aid to locating it.

\* these fields are omitted for parents (or children) in the same cycle as the function. If the function (or child) is a member of a cycle, the propagated times and propagation denominator represent the self time and descendent time of the cycle as a whole.

\*\* static-only parents and children are indicated by a call count of 0.

cycle listings:

the cycle as a whole is listed with the same fields as a function entry. Below it are listed the members of the cycle, and their contributions to the time and call counts of the cycle.

granularity: each sample hit covers 8 byte(s) for 0.00% of 21.05 seconds

index	%time	self	descendents	called/total called+self called/total	parents name	children	index
-------	-------	------	-------------	---	-----------------	----------	-------

```

```

flat profile:

%            the percentage of the total running time of the  
time            program used by this function.

cumulative    a running sum of the number of seconds accounted  
seconds        for by this function and those listed above it.

self           the number of seconds accounted for by this  
seconds        function alone. This is the major sort for this  
              listing.

calls         the number of times this function was invoked, if  
              this function is profiled, else blank.

self           the average number of milliseconds spent in this  
ms/call        function per call, if this function is profiled,  
              else blank.

total         the average number of milliseconds spent in this  
ms/call        function and its descendents per call, if this  
              function is profiled, else blank.

name          the name of the function. This is the minor sort  
              for this listing. The index shows the location of  
              the function in the gprof listing. If the index is  
              in parenthesis it shows where it would appear in  
              the gprof listing if it were to be printed.

granularity: each sample hit covers 8 byte(s) for 0.00% of 21.05 seconds

```

%   cumulative   self             self       total
time  seconds    seconds   calls  ms/call  ms/call  name
