

File System Implementation

File-System Structure

- File structure
 - Logical storage unit
 - Collection of related information
- File system resides on secondary storage (disks)
- File system organized into layers
- **File control block** – storage structure consisting of information about a file

2

A Typical File Control Block

file permissions
file dates (create, access, write)
file owner, group, ACL
file size
file data blocks or pointers to file data blocks

3

In-Memory File System Structures

4

File System Layout

- File System is stored on disks
 - Disk is divided into 1 or more partitions
 - Sector 0 of disk called Master Boot Record
 - End of MBR has partition table (start & end address of partitions)
- First block of each partition has boot block
 - Loaded by MBR and executed on boot

5

Allocation Methods

- An allocation method refers to how disk blocks are allocated for files:
- **Contiguous allocation**
- **Linked allocation**
- **Indexed allocation**

6

Contiguous Allocation

- Each file occupies a set of contiguous blocks on the disk
- Simple – only starting location (block #) and length (number of blocks) are required
- Random access
- Wasteful of space (dynamic storage-allocation problem)
- Files cannot grow

7

Contiguous Allocation of Disk Space

8

Linked Allocation

9

File-Allocation Table

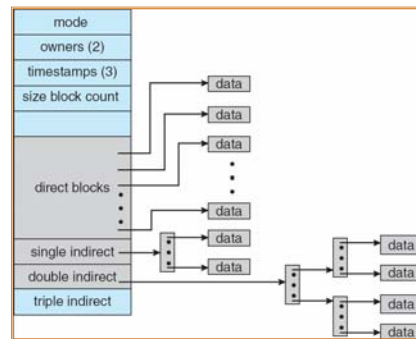

10

Example of Indexed Allocation

11

Combined Scheme: UNIX (4K bytes per block)

12

Free-Space Management

- Bit vector (n blocks)

$$\text{bit}[i] = \begin{cases} 0 \Rightarrow \text{block}[i] \text{ free} \\ 1 \Rightarrow \text{block}[i] \text{ occupied} \end{cases}$$

Block number calculation

$$\begin{aligned} &(\text{number of bits per word}) * \\ &(\text{number of 0-value words}) + \\ &\text{offset of first 1 bit} \end{aligned}$$

13

Free-Space Management (Cont.)

- Bit map requires extra space
 - Example:
 - block size = 2^{12} bytes
 - disk size = 2^{30} bytes (1 gigabyte)
 - $n = 2^{30}/2^{12} = 2^{18}$ bits (or 32K bytes)
- Easy to get contiguous files
- Linked list (free list)
 - Cannot get contiguous space easily
 - No waste of space
- Grouping (many links per block)
- Counting (aggregate continuous blocks)

14

Linked Free Space List on Disk

15

Directory Implementation

- Each directory is a file
- Linear list of file names with pointer to the data blocks
 - simple to program
 - time-consuming to execute
- Hash Table – linear list with hash data structure
 - decreases directory search time
 - **collisions** – situations where two file names hash to the same location
 - fixed size

16

Efficiency and Performance

- Efficiency dependent on:
 - disk allocation and directory algorithms
 - types of data kept in file's directory entry
- Performance
 - disk cache – separate section of main memory for frequently used blocks
 - free-behind and read-ahead – techniques to optimize sequential access
 - improve PC performance by dedicating section of memory as virtual disk, or RAM disk

17

Page Cache

- A **page cache** caches pages rather than disk blocks using virtual memory techniques
- Memory-mapped I/O uses a page cache
- Routine I/O through the file system uses the buffer (disk) cache
- Sync, Async, flush

18

I/O Using a Unified Buffer Cache

19

Recovery

- Consistency checking – compares data in directory structure with data blocks on disk, and tries to fix inconsistencies
- Use system programs to **back up** data from disk to another storage device (floppy disk, magnetic tape, other magnetic disk, optical)
- Recover lost file or disk by **restoring** data from backup

20

Log Structured File Systems

- **Log structured** (or journaling) file systems record each update to the file system as a **transaction**
- All transactions are written to a **log**
 - A transaction is considered **committed** once it is written to the log
 - However, the file system may not yet be updated
- The transactions in the log are asynchronously written to the file system
 - When the file system is modified, the transaction is removed from the log
- If the file system crashes, all remaining transactions in the log must still be performed
