Introduction

CS 4410

What is a system?

"A complex unit formed of many often diverse parts subject to a common plan or serving a common purpose"

Webster Third New International Dictionary

We study a system

What is a system?

“A complex unit formed of many often diverse parts subject to a common plan or serving a common purpose”

“Set of interconnected components with an expected behavior observed at the interface with its environment”

Webster Third New International Dictionary
Common systems challenges

- Emergent properties
- Propagation of effects
- Incommensurate scaling
- Trade-offs

Propagation of effects

- Redesign wheel well
- Redesign trunk for bigger spare wheel
- Move back seat slightly forward
- Thin back seat
- Stiffen rear springs
- Change speedometer gearing

To improve ride experience, change wheels from 14” to 16”

Incommensurate scaling

As the system increases in size or speed, not all components can manage the scale, and things break down

- WHO sprayed villages in N. Borneo with DDT
- Wiped out mosquitos, but...
- Roaches collected DDT in tissue
- Lizard ate roaches, and became slower
- Easy target for cats
- DDT cause cats to die
- Forest rats moved into villages
- Rats carried the bacillus of the plague!

J.B.S. Haldane

10x higher than Jack!
but also 10x wider and thicker!

About 1000x Jack’s weight — but their cross section of their bones was only 100x Jack’s

A human thigh bone breaks at about 10x human weight

The giant would have broken his thighs every time he was taking a step!

On being the right size

J.B.S. Haldane
Inevitable Trade-offs

Speed vs power in processors
Bandwidth vs computation in compression
Space vs time almost everywhere
A pawn vs better position in chess

How to Manage Complexity

Modularity
- Good modularity minimizes connections between components

Abstraction
- Separate interface from internals; separate specification from implementation

Hierarchy/Layering
- Constrain interactions so they are easier to understand

What is an OS?

An Operating System implements a virtual machine whose interface is more convenient* that the raw hardware interface

* easier to use, simpler to code, more reliable, more secure...

OS wears many hats

Referee
- Manages shared resources: CPU, memory, disks, networks, displays, cameras...

Illusionist
- Look! Infinite memory! Your own private processor!

Glue
- Offers a set of common services (e.g., UI routines)
- Separates apps from I/O devices

THE Operating system

EWD 196, 1965
OS as Referee

Resource allocation
- Multiple concurrent tasks, how does OS decide who gets how much?

Isolation
- A faulty app should not disrupt other apps or OS

Communication/Coordination
- Apps need to coordinate and share state

OS as Illusionist

Virtualization
- Processor, memory, screen space, disk, network
- The entire computer
  - Fooling the OS itself!
  - Eases debugging, portability, isolation

Appearance of resources not physically present
- Operating System
- Hardware

Atomic operations
- HW guarantees atomicity at the word level...
  - What happens during concurrent updates to complex data structures?
  - What is a computer crashes while writing a file block?
- At the hardware level, packets are lost
  - Reliable communication channels
OS as Glue

- Offers standard services to simplify app design and facilitate sharing
  - Send/Receive byte streams
  - Read/Write files
  - Pass messages
  - Share memory
  - UI
- Decouples HW and app development

What will the course be like?
Issues in OS Design

- **Structure**: how is the OS organized?
- **Concurrency**: how are parallel activities created and controlled?
- **Sharing**: how are resources shared?
- **Naming**: how are resources named by users?
- **Protection**: how are distrusting parties protected from each other?
- **Security**: how to authenticate, authorize, and ensure privacy?
- **Performance**: how to make it fast?

More Issues in OS Design

- **Reliability**: how do we deal with failures??
- **Portability**: how to write once, run anywhere?
- **Extensibility**: how do we add new features?
- **Communication**: how do we exchange information?
- **Scale**: what happens as demands increase?
- **Persistence**: how do we make information outlast the processes that created it?
- **Accounting**: who pays the bill and how do we control resource usage?
