## Computer Networks: Architecture and Protocols

### Lecture 5 - Design Goals

**Rachit Agarwal**

# Acknowledgments

- You have been a great class so far
  - Most of you are quiet and paying attention
  - **You** are giving great answers!
  - Even more importantly, **you** are asking great questions!
- Thank you!

# Announcements

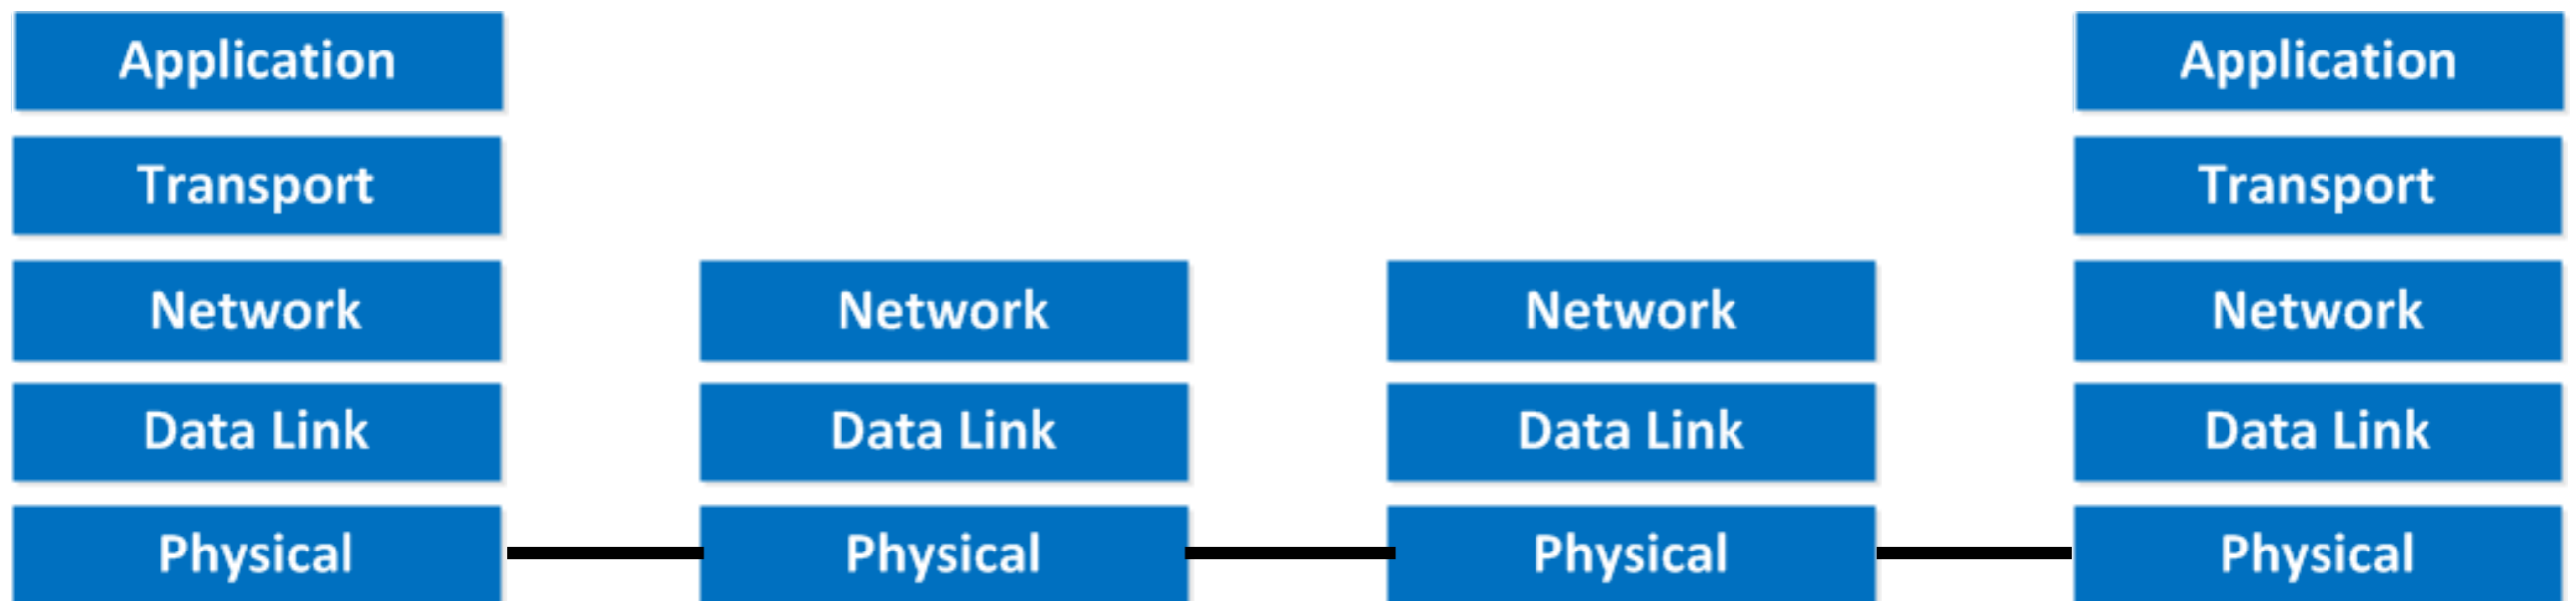

- **Course webpage is your one-stop shop**
- **Office hours have been announced**
  - We start immediately (starting today)
- **If you register(ed) for the course today**
  - Please send us an email to add you on Canvas/Ed Discussions
  - For seat allocation (if in-person)
- **Your current seats are now final seats :)**

# Context for Today's Lecture

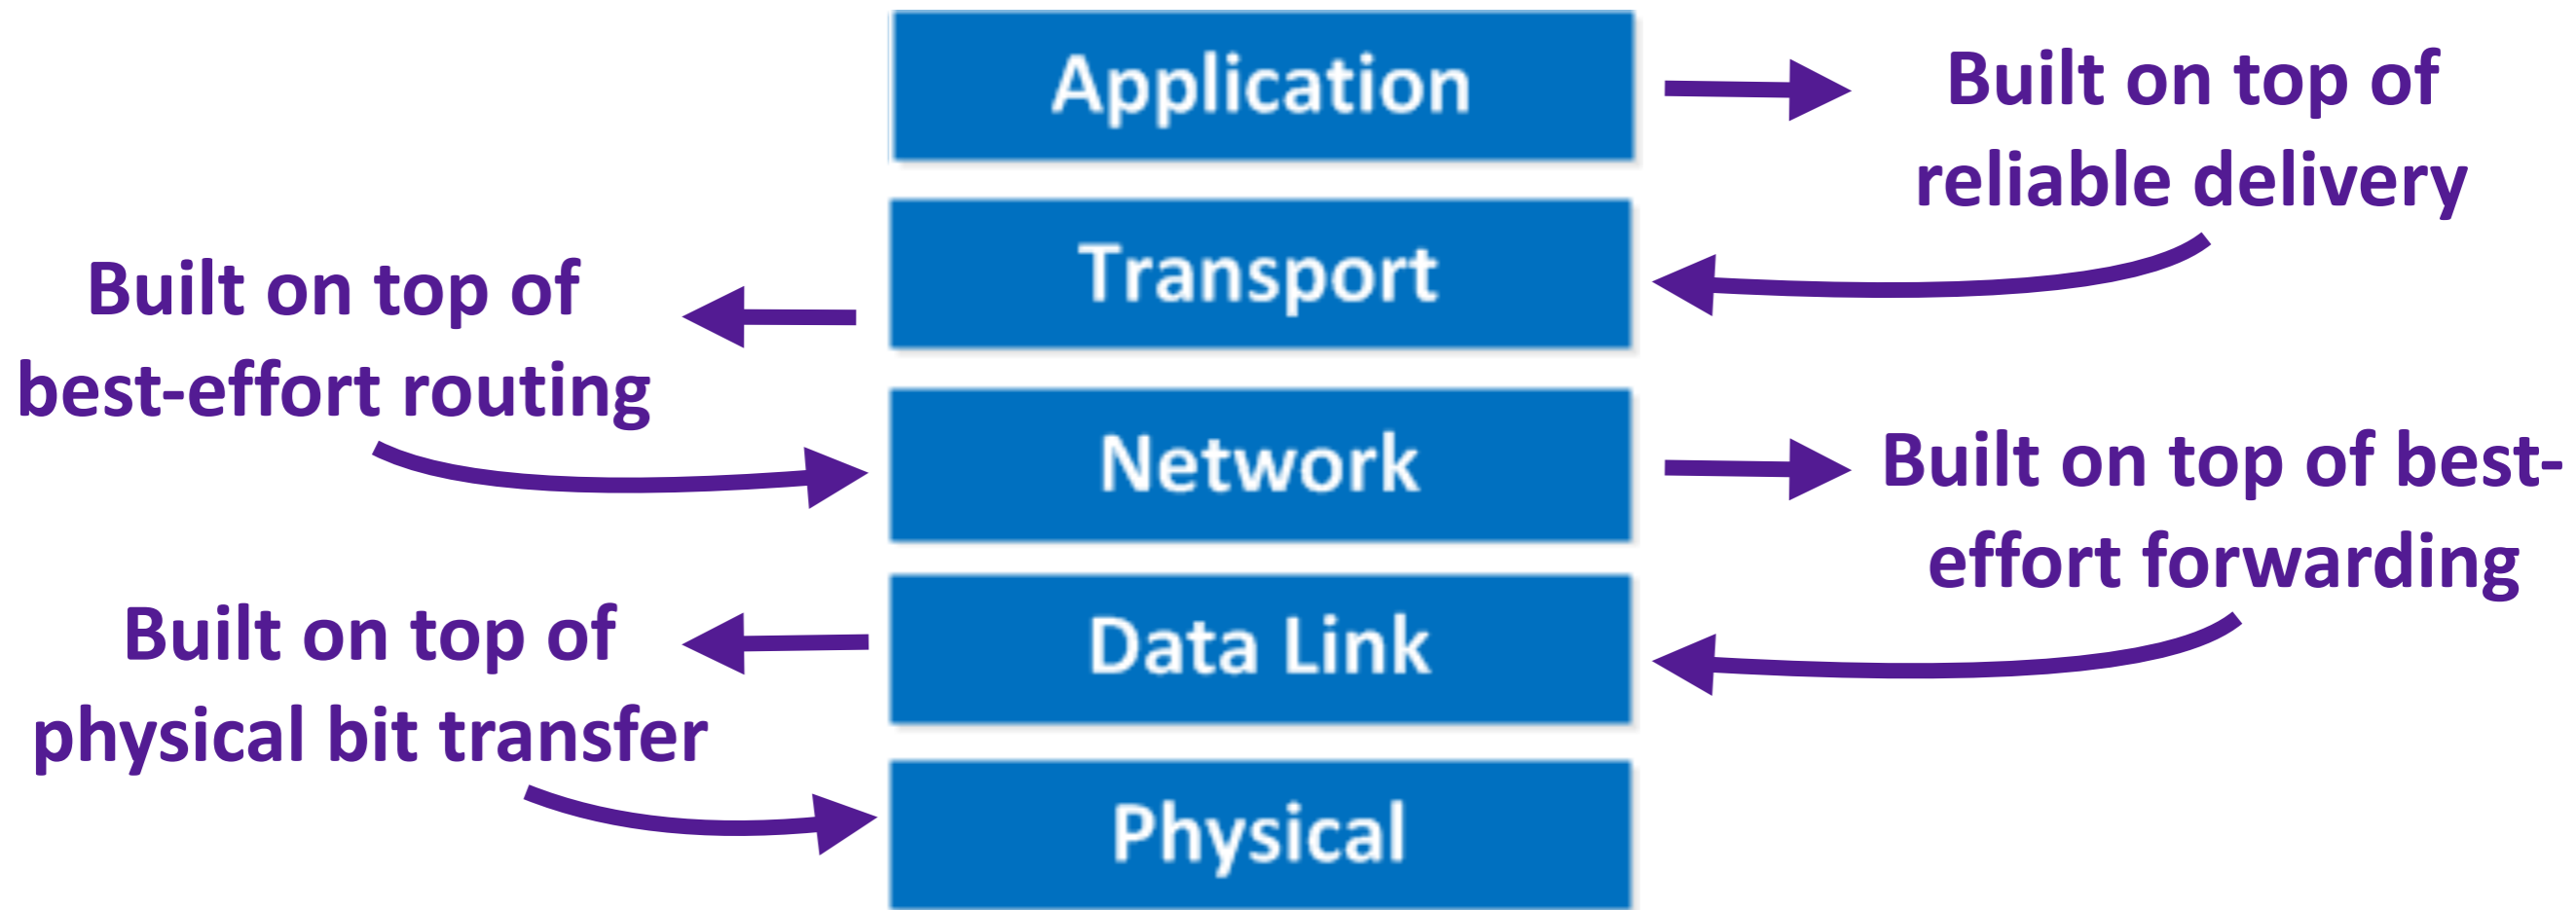

- **Solving problems related to propagation and transmission delays**
  - Some in-class exercises
  - We will solve them together
- **Why was the Internet designed the way it was?**

# Recap: Three design principles

- How to break system into modules
  - **Layering**
- Where are modules implemented
  - **End-to-End Principle**
- Where is state stored?
  - **Fate-Sharing**

# Recap: Layering

- **A kind of modularity**

- Functionality separated into layers
- Layer  $n$  **interfaces with only layer  $n-1$  and layer  $n+1$** 
  - Hides complexity of surrounding layers

# Recap: End-to-end Principle (Interpretation)

**Assume** the condition (IF) holds. Then,

- **End-to-end implementation**
  - Correct
  - Generalized, and simplifies lower layers
- **In-network implementation**
  - Insufficient
  - May help — or hurt — performance

# Recap: Fate-Sharing

- When storing state in a distributed system, colocate it with entities that rely on that state
- Only way failure can cause loss of the critical state is if the entity that cares about it also fails ...
  - ... in which case it doesn't matter
- Often argues for keeping state at end hosts rather than inside routers
  - E.g., packet switching rather than circuit switching

# Recap: Decisions and their Principles

- How to break system into modules
  - **Dictated by layering**
- Where modules are implemented
  - **Dictated by End-to-End Principle**
- Where state is stored
  - **Dictated by Fate Sharing**

**Questions?**

# **From Architecture to Design: Design Goals**

# David Clark

- Wrote a paper in 1988 that tried to capture why the Internet turned out as it did
- It described an ordered list of priorities that informed the decision
- What do you think those priorities were?

# Internet Design Goals (Clark '88)

- **Connect existing networks**
- Robust in face of failures
- Support multiple types of delivery services
- Accommodate a variety of networks
- Allow distributed management
- Easy host attachment
- Cost effective
- Allow resource accountability

# #1: Connect Existing Networks

Want one protocol that could be used to connect any pair of (existing) networks

- Different networks may have different needs
  - For some: reliable delivery more important
  - For others: performance more important
  - **But there is one need that every network has: connectivity**
- The Internet Protocol (IP) is that unifying protocol
  - All (existing) networks must be able to implement it

## #2: Robust in Face of Failures

As long as network is not partitioned, two hosts should be able to communicate (eventually)

- Must **eventually recover** from failures
- Very successful in the past; unclear how relevant now
  - **Availability** is becoming increasingly important than **recovery**

# #3: Support Multiple Types of Delivery Services

**Different delivery services (applications) should be able to co-exist**

- Already implies an application-neutral framework
- Build lowest common denominator service
  - **Again: connectivity**
  - Applications that need reliability may use it
  - Applications that do not need reliability can ignore it
- **This isn't as obvious as it seems...**
  - What would applications in 2050 need?

**Questions?**

# #4: Variety of Networks

**Must be able to support different networks with different hardware**

- **Incredibly successful!**

- Minimal requirements on networks
- No need for reliability, in-order, fixed size packets, etc.
- A result of aiming for lowest common denominator

- **Again: Focus on connectivity**

- Let networks do specific implementations for other functionalities
- Automatically adapt: WiFi, LTE, 3G, 4G, 5G ....

# #5: Decentralized Management

**No need to have a single “vantage” point to manage networks**

- Both a curse and a blessing
  - Important for easy deployment
  - Makes management hard today
- Recent efforts have improved management of individual networks
  - But no attempt to manage the Internet as a whole...
  - What might make this complex?

# #6: Easy Host Attachment

**The mechanism that allows hosts to attach to networks must be made as easy as possible, but no easier**

- Clark observes that cost of host attachment may be higher because hosts had to be smart
- But the administrative cost of adding hosts is very low, which is probably more important
  - Plug-and-play kind of behavior...
- And now most hosts are smart for other reasons
  - So the cost is actually minimal...

# #7: Cost Effective

**Make networks as cheap as possible, but no cheaper**

- Cheaper than circuit switching at low end
- More expensive than circuit switching at high end
- Not a bad compromise:
  - Cheap where it counts (low-end)
  - More expensive for those who can pay...

# #8: Resource Accountability

**Each network element must be made accountable for its resource usage**

- Failure!

# Real Goals

- **Build something that works**
- Connect existing networks
- Robust in face of failures
- Support multiple types of delivery service
- Accommodate a variety of networks
- Allow distributed management
- Easy host attachment
- Cost effective
- Allow resource accountability

# Questions to think about

- What goals are missing from this list?
  - **Suggestions?**
- What would the resulting design look like?

# Some of the missing issues

- **Performance**
- Security
  - Resilience to attacks (denial-of-service)
  - Endpoint security
  - Tracking down misbehaving users
- Privacy
- Availability
- Resource sharing (fairness, etc.)
- ISP-level concerns
  - Economic issues of interconnection

**Questions?**

# Next lecture

- Beginning of “Design of computer networks”
- Start with Layer 1 and Layer 2
  - Physical bits (very little)
  - Local best-effort forwarding
  - Lots of interesting aspects
  - Lots of group activities
  - ...
