# Scaling

$$\begin{bmatrix} x' \\ y' \\ z' \\ 1 \end{bmatrix} = \begin{bmatrix} s_x & 0 & 0 & 0 \\ 0 & s_y & 0 & 0 \\ 0 & 0 & s_z & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

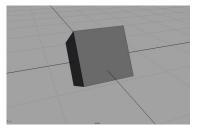

Cornell CS4620/5620 Fall 2011 • Lecture 10

#### Rotation about z axis

$$\begin{bmatrix} x' \\ y' \\ z' \\ 1 \end{bmatrix} = \begin{bmatrix} \cos \theta & -\sin \theta & 0 & 0 \\ \sin \theta & \cos \theta & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

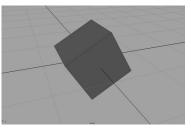

Cornell CS4620/5620 Fall 2011 • Lecture 10

#### Rotation about x axis

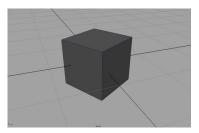

$$\begin{bmatrix} x' \\ y' \\ z' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & \cos \theta & -\sin \theta & 0 \\ 0 & \sin \theta & \cos \theta & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

Cornell CS4620/5620 Fall 2011 • Lecture 10

### Rotation about y axis

$$\begin{bmatrix} x' \\ y' \\ z' \\ 1 \end{bmatrix} = \begin{bmatrix} \cos \theta & 0 & \sin \theta & 0 \\ 0 & 1 & 0 & 0 \\ -\sin \theta & 0 & \cos \theta & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

#### **General rotations**

- A rotation in 2D is around a point
- A rotation in 3D is around an axis
  - -so 3D rotation is w.r.t a line, not just a point
  - -there are many more 3D rotations than 2D
    - · a 3D space around a given point, not just ID

Cornell CS4620/5620 Fall 2011 • Lecture 10

# **Specifying rotations**

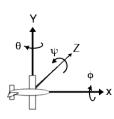

- In 3D, specifying a rotation is more complex
  - -basic rotation about origin: unit vector (axis) and angle
    - convention: positive rotation is CCW when vector is pointing at you
- Many ways to specify rotation
  - -Euler angles: 3 angles about 3 axes
  - -(Axis, angle) rotation
  - $-\,Quaternions$

Cornell CS4620/5620 Fall 2011 • Lecture 9

#### 3D rotations

- · An object can be oriented arbitrarily
- Euler angles: stack up three coord axis rotations
  - ZYX case: Rz(thetaz)\*Ry(thetay)\*Rx(thetax)
  - heading, attitude, bank (NASA standard airplane coordinates)
  - pitch, head, roll

### **Specifying rotations: Euler rotations**

Euler angles

$$\begin{split} R(\theta_{x},\theta_{y},\theta_{z}) &= R_{z}(\theta_{z})R_{y}(\theta_{y})R_{x}(\theta_{x}) \\ R(\theta_{x},\theta_{y},\theta_{z}) &= \begin{bmatrix} c_{y}c_{z} & s_{x}s_{y}c_{z} - c_{x}s_{z} & c_{x}s_{y}s_{z} - s_{x}c_{z} & 0 \\ c_{y}s_{z} & s_{x}s_{y}s_{z} + c_{x}c_{z} & c_{x}s_{y}s_{z} - s_{x}c_{z} & 0 \\ -s_{y} & s_{x}c_{y} & c_{x}c_{y} & 0 \\ 0 & 0 & 0 & 0 & 1 \end{bmatrix} \end{split}$$

 $c_i = \cos(\theta_i)$  $s_i = \sin(\theta_i)$ 

Cornell CS4620/5620 Fall 2011 • Lecture 10

# **Euler angles**

· Gimbal lock removes one degree of freedom

$$R(\theta_{x}, \theta_{y}, \theta_{z}) = \begin{bmatrix} 0 & \sin(\theta_{x} - \theta_{z}) & \cos(\theta_{x} - \theta_{z}) & 0 \\ 0 & \cos(\theta_{x} - \theta_{z}) & \sin(\theta_{x} - \theta_{z}) & 0 \\ -1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

## Coming up with the matrix

- Showed matrices for coordinate axis rotations
  - -but what if we want rotation about some random axis?
- Compute by composing elementary transforms
  - -transform rotation axis to align with x axis
  - ti alisioi ili Totatioli axis ti
  - -apply rotation
  - -inverse transform back into position
- Just as in 2D this can be interpreted as a similarity transform

Cornell CS4620/5620 Fall 2011 • Lecture 10

© 2011 Kavita Bala • 14

# **Properties of Rotation Matrices**

• Columns of R are mutually orthonormal: RR<sup>T</sup>=R<sup>T</sup>R=I

• Right-handed coordinate systems: det(R)=1

$$\left| \begin{array}{ccc} a & b & c \\ d & e & f \\ g & h & k \end{array} \right| = a \left| \begin{array}{ccc} e & f \\ h & k \end{array} \right| - b \left| \begin{array}{ccc} d & f \\ g & k \end{array} \right| + c \left| \begin{array}{ccc} d & e \\ g & h \end{array} \right|$$

## **Building general rotations**

- Using elementary transforms you need three
  - -translate axis to pass through origin
  - rotate about y to get into x-y plane
  - -rotate about z to align with x axis
- Alternative: construct frame and change coordinates
  - choose p, u, v, w to be orthonormal frame with p and u matching the rotation axis
  - -apply similarity transform  $T = F R_{x}(\theta) F^{-1}$

Cornell CS4620/5620 Fall 2011 • Lecture 10

#### Orthonormal frames in 3D

- Useful tools for constructing transformations
- Recall rigid motions
  - -affine transforms with pure rotation and translation
  - -columns (and rows) form right-handed ONB
    - that is, an orthonormal basis

$$F = \begin{bmatrix} u_x & v_x & w_x \\ u_y & v_y & w_y \\ u_z & v_z & w_z \end{bmatrix}$$

Cornell CS4620/5620 Fall 2011 • Lecture 10

# **Building 3D frames**

- Given a vector a and a secondary vector b
  - The **u** axis should be parallel to **a**; the **u-v** plane should contain **b** 
    - •u = u / ||u||
    - $\mathbf{w} = \mathbf{u} \times \mathbf{b}$ ;  $\mathbf{w} = \mathbf{w} / ||\mathbf{w}||$
    - $\cdot v = w \times u$
- Given just a vector **a** 
  - The  ${\bf u}$  axis should be parallel to  ${\bf a}$ ; don't care about orientation about that axis
    - Same process but choose arbitrary **b** first
    - Good choice is not near a: e.g. set smallest entry to I

Cornell CS4620/5620 Fall 2011 • Lecture 10

# **Building general rotations**

- Alternative: construct frame and change coordinates
  - choose p, u, v, w to be orthonormal frame with p and u matching the rotation axis
  - –apply similarity transform  $T = F R_x(\theta) F^{-1}$
  - interpretation: move to x axis, rotate, move back
  - -interpretation: rewrite *u*-axis rotation in new coordinates
  - (each is equally valid)

$$\begin{bmatrix} u_x & v_x & w_x \\ u_y & v_y & w_y \\ u_z & v_z & w_z \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos(\theta) & -\sin(\theta) \\ 0 & \sin(\theta) & \cos(\theta) \end{bmatrix} \begin{bmatrix} u_x & u_y & u_z \\ v_x & v_y & v_z \\ w_x & w_y & w_z \end{bmatrix}$$
