

CS4620/5620: Lecture 24

Texture Mapping

Announcements

- HW 3 out
 - Barycentric coordinates for Problem 1

Texture mapping from 0 to infinity

- When you go close...

When viewed from a distance

- Aliasing!

How does area map over distance?

- At optimal viewing distance:
 - One-to-one mapping between pixel area and texel area
- When closer
 - Each pixel is a small part of the texel
- When farther
 - Each pixel could include many texels

Minification: Theoretical Solution

- Find the area of pixel in texture space
- “Filter” the area to compute “average” texture color
 - Filtering eliminates high frequency artifacts
- How to filter?
 - Analytically compute area
 - Super-sample
 - But too expensive

MIP Maps

- MIP Maps
 - Multum in Parvo: Much in little
 - Proposed by Lance Williams
- Stores pre-filtered/averaged versions of texture
- Supports very fast lookup
- Assumptions:
 - Can't really precompute every possible required area
 - But can precompute some areas

Image Pyramid

Filtering by Averaging

- Each pixel in a level corresponds to 4 pixels in lower level
 - Average
 - Gaussian filtering (more on this next lecture)

Using the MIP Map

- Find the MIP Map level where the pixel has a 1-to-1 mapping
- How?
 - Find largest side of pixel footprint in texture space
 - Pick level where that side corresponds to a texel
 - Compute derivatives to find pixel footprint

Given derivatives: what is level?

$$level = \log[\max(\frac{du}{dx}, \frac{dv}{dx}, \frac{du}{dy}, \frac{dv}{dy})]$$

$$level = \log \sqrt{(\frac{du}{dx})^2 + (\frac{dv}{dx})^2 + (\frac{du}{dy})^2 + (\frac{dv}{dy})^2}$$

- Gradients
 - Available in pixel shader

Using the MIP Map

- In level, find texel and
 - Return the texture value: point sampling
 - Bilinear interpolation
 - Trilinear interpolation

Level i

Level i+1

Memory Usage

- What happens to size of texture?

MIPMAP

- Multi-resolution image pyramid
 - Pre-sampled computation of MIPMAP
 - 1/3 more memory
- Bilinear or Trilinear interpolation

Filtered Texturing

point sampled

mipmapped

Filtered Texturing

point sampled

tables

Some basic assumptions

- Assume that the pixel only maps to squares in texture space
- In fact, assume it maps to squares at particular locations

Sampling and Antialiasing

Sampled representations

- How to store and compute with continuous functions?
- Common scheme for representation: samples
 - write down the function's values at many points

[FOFH fig. 1.4.1b / Webberg]

Reconstruction

- Making samples back into a continuous function
 - for output (need realizable method)
 - for analysis or processing (need mathematical method)
 - amounts to “guessing” what the function did in between

[FOFH fig. 1.4.1b / Webberg]

Filtering

- Processing done on a function
 - can be executed in continuous form (e.g. analog circuit)
 - but can also be executed using sampled representation
- Simple example: smoothing by averaging

Roots of sampling

- Nyquist 1928; Shannon 1949
 - famous results in information theory
- 1940s: first practical uses in telecommunications
- 1960s: first digital audio systems
- 1970s: commercialization of digital audio
- 1982: introduction of the Compact Disc
 - the first high-profile consumer application
- This is why all the terminology has a communications or audio “flavor”
 - early applications are 1D; for us 2D (images) is important

Sampling in digital audio

- Recording: sound to analog to samples to disc
- Playback: disc to samples to analog to sound again
 - how can we be sure we are filling in the gaps correctly?

Undersampling

- What if we “missed” things between the samples?
- Simple example: undersampling a sine wave
 - unsurprising result: information is lost
 - surprising result: indistinguishable from lower frequency
 - also was always indistinguishable from higher frequencies
 - *aliasing*: signals “traveling in disguise” as other frequencies

Preventing aliasing

- Introduce lowpass filters:
 - remove high frequencies leaving only safe, low frequencies
 - choose lowest frequency in reconstruction (disambiguate)
