## Handout 1: Notation and Probability

Instructor: Rafael Pass Teaching Assistant: Huijia (Rachel) Lin

### Notation

## Algorithm

Let  $\mathcal{A}$  denote an algorithm. We write  $\mathcal{A}(\cdot)$  to denote an algorithm with one input and  $\mathcal{A}(\cdot,\cdot)$  for two inputs. In general, the output of an algorithm can be considered as a probability distribution. So  $\mathcal{A}(x)$  denotes a probability distribution. The algorithm is deterministic if the distribution is concentrated on a single element.

### Experiment

To sample an element x from a distribution S we denote the experiment by  $x \leftarrow S$ . If F is a finite set, then  $x \leftarrow F$  is the experiment of sampling uniformly from the set F. To denote the ordered sequence in which the experiments happen we use semicolon.

$$(x \leftarrow \mathcal{S}; (y, z) \leftarrow \mathcal{A}(x))$$

Using this notation we can describe probability of events. If  $p(\cdot,\cdot)$  denotes a predicate, then

$$\Pr[x \leftarrow \mathcal{S}; (y, z) \leftarrow \mathcal{A}(x) : p(y, z)]$$

is the probability that the predicate p(y,z) is true after the ordered sequence of events  $(x \leftarrow S; (y,z) \leftarrow A(x))$ . The notation  $\{x \leftarrow S; (y,z) \leftarrow A(x) : (y,z)\}$  denotes the probability distribution on  $\{(y,z)\}$  generated by the ordered sequence of experiments  $(x \leftarrow S; (y,z) \leftarrow A(x))$ .

# Probability

### **Basic Facts**

• Events A and B are said to be independent if

$$\Pr[A \cap B] = \Pr[A] \cdot \Pr[B]$$

- Events  $A_1, A_2, \ldots, A_n$  are said to be *pairwise independent* if for every i and every  $j \neq i$ ,  $A_i$  and  $A_j$  are independent.
- Union Bound: Let  $A_1, A_2, \ldots, A_n$  be events. Then,

$$\Pr[A_1 \cup A_2 \cup \ldots \cup A_n] \le \Pr[A_1] + \Pr[A_2] + \ldots \Pr[A_n]$$

• Let X be a random variable with range  $\Omega$ . The expectation of X is a number defined as follows.

$$\mathbb{E}[X] = \sum_{x \in \Omega} x \Pr[X = x]$$

The *variance* is given by,

$$Var[X] = \mathbb{E}[X^2] - (\mathbb{E}[X])^2$$

• Let  $X_1, X_2, \ldots, X_n$  be random variables. Then,

$$\mathbb{E}[X_1 + X_2 + \dots + X_n] = \mathbb{E}[X_1] + \mathbb{E}[X_2] + \dots + \mathbb{E}[X_n]$$

 $\bullet$  If X and Y are independent random variables, then

$$\mathbb{E}[XY] = \mathbb{E}[X] \cdot \mathbb{E}[Y]$$

$$Var[X + Y] = Var[X] + Var[Y]$$

### Markov's Inequality

If X is a positive random variable with expectation E(X) and a > 0, then

$$\Pr[X \ge a] \le \frac{\mathbb{E}(X)}{a}$$

## Chebyshev's Inequality

Let X be a random variable with expectation E(X) and variance  $\sigma^2$ , then for any k > 0,

$$\Pr[|X - \mathbb{E}(X)| \ge k] \le \frac{\sigma^2}{k^2}$$

## Chernoff's inequality

Let  $X_1, \ldots, X_n$  denote independent random variables with  $|X_i| \leq 1$ , and let  $S = X_1 + \cdots + X_n$ . Then

$$\Pr\left[\frac{1}{n}\left|S - \mathbb{E}[S]\right| \ge \varepsilon\right] \le 2e^{-\frac{1}{2}\varepsilon^2 n} \in 2^{-O(\varepsilon^2 n)}$$
