SUPERCLOUD: GOING BEYOND FEDERATED CLOUDS
should we migrate critical data to computation or vice versa?

- e.g. app needs to import or export data
Should we migrate critical data to computation or vice versa?

E.g. app needs to import or export data

Challenges

- Limited bandwidth tactical networks
- Interoperability
- Secure sharing

How can we securely and efficiently migration computation across the cloud?
INFRASTRUCTURE AS A SERVICE

- Offer on-demand virtual machines
- Charge according to used hours
- Multiple data center locations
PROBLEM – SINGLE CLOUD

- Vendor lock-in
  - Latency limitation
  - No control of price
  - Availability limitation

Which one? Price? Migration? Availability?
BENEFITS OF MULTIPLE CLOUDS

Provide power, control and flexibility to user

Multi-cloud

- Lower latency
- Reduce Cost
- Higher availability
- Burst Relief
- Security Improvement
The Supercloud goes beyond a Federated Cloud in that it

- supports *user-level* migration between autonomous clouds;
- Permits environment to include “stubs” for resources that actually are tied to specific places, making them seem to be available from anywhere;
- supports a variety of underlying virtual machine monitors;
- supports a shared but decentralized storage system and a novel virtualized network that can migrate with the app;
- supports system-wide pub/sub for event notification.
Unshackle the Cloud: xClouds

- Bring **extensibility** into IaaS clouds
- Allow users to run or implement **their own hypervisor-level services**
- Avoid lock-in with **user-centric homogenization**

*Old slides from Hakim...*
How to Build xClouds

- Users are isolated
- VMM composed of modules
How to Build xClouds

- Users are isolated

Backend

Frontend

Frontend

PCI-Driver

Linux Dom0

Backend
xClouds works Today!

- Nested paravirtual device drivers
- Xen on EC2
xCLOUDS works Today!

- Nested paravirtual device drivers
- Xen on EC2

- Can create your own

Cloud-within-a-Cloud
- Event-Channel Drivers for virtual interrupts
  - One for Receive Event from 1st-Layer Xen: virtual interrupts
  - One for multiplexing to nested DomU
- Grant Page Table Drivers for shared memory
  - One for Shared Ring buffer with 1st-Layer Dom0
  - One for sharing memory with/or between nested DomUs
- Two Xenbus drivers
  - One for connect to 1st-Layer shared memory devices
  - One for nested DomUs to connect to nested shared memory devices
- Block and Net Frontend Drivers
  - For virtual disk and network devices of nested Dom0
Need Hypercall Passthrough

- Nested Dom0 must be able to get information about shared memory devices from 1st Layer-Xen

- Nested Dom0 can only issue hypercall to Nested Xen
  - So, nested Xen should help passthrough related hypercalls
KILLER APPS FOR THE SUPERCLOUD

- Sensitive Resource
- Follow the sun
- Geographic proximity
- Spot Instances
- Dynamic Resource Scaling
- Bursting
Sensitive resource

- Some provider has a special device, or special data
- Supercloud allows you to add a “stub” for it to your environment. Looks like a normal local device or local data file/database

If you access the resource, SuperCloud migrates your VM to where it resides

- Moving computation to data on demand avoids locking app to the place where that resource resides
Uniform VM image?
- using nested virtualization

Cross-cloud migration?
- developed a new image storage facility

Transparent networking?
- based on SDN: Open vSwitch and VXLAN
BENEFITS OF MULTIPLE CLOUDS

Provide power, control and flexibility to user

Multi-cloud

- Lower latency
- Reduce Cost
- Higher availability
- Burst Relief
- Security Improvement
Which data center is closer?
CONTENT DELIVERY NETWORK

Minimum Latency (ms)

- RackSpace
- Amazon
- HP Cloud
- SuperCloud
CONTENT DELIVERY NETWORK
SuperCloud is closer to the clients

Supercloud and Rackspakce has the lowest Latency

SuperCloud and Amazon has the lowest Latency
BENEFITS OF MULTIPLE CLOUDS

Provide power, control and flexibility to user

- Lower latency
- Reduce Cost
- Higher availability
- Burst Relief
- Security Improvement
Amazon Spot Instance
- Dramatic Price Change
- Usually Cheap
- Charges hourly
- Ready to be terminated

Can’t save money when prices goes high

Only stateless jobs!
SuperCloud on Spot Instances

- Migrate out to other places when instances being terminated
- Migrate to the cheapest place when starting new billing hours

Benefits

- No termination
- Lower budget
SPOT INSTANCE PRICE HISTORY

Spot price goes very high sometimes

Spot price is usually low

Regular instances have stable price

Supercloud is migrated to the cheapest place every hour

Migrate supercloud to regular instances
Smart spot instances save money!
SuperCloud uses Xen on Xen virtualization

- Has some extra overheads, obviously
- But enables migration of the entire VM and its runtime environment

SuperCloud is able to...

- Moves computation to data if data is big, sensitive, special device on a special host, etc
- Can also migrate to chase lowest-priced resources

Transparent to the application: standard OS APIs
