

Data Center Traffic and Measurements: Available Bandwidth Estimation

Hakim Weatherspoon

Assistant Professor, Dept of Computer Science

CS 5413: High Performance Systems and Networking

November 14, 2014

Slides from ACM SIGCOMM conference on Internet measurement (IMC), 2014,
presentation of “MinProbe: Accurate, Minimum Overhead, Available Bandwidth
Estimation in High Speed Wired Networks”

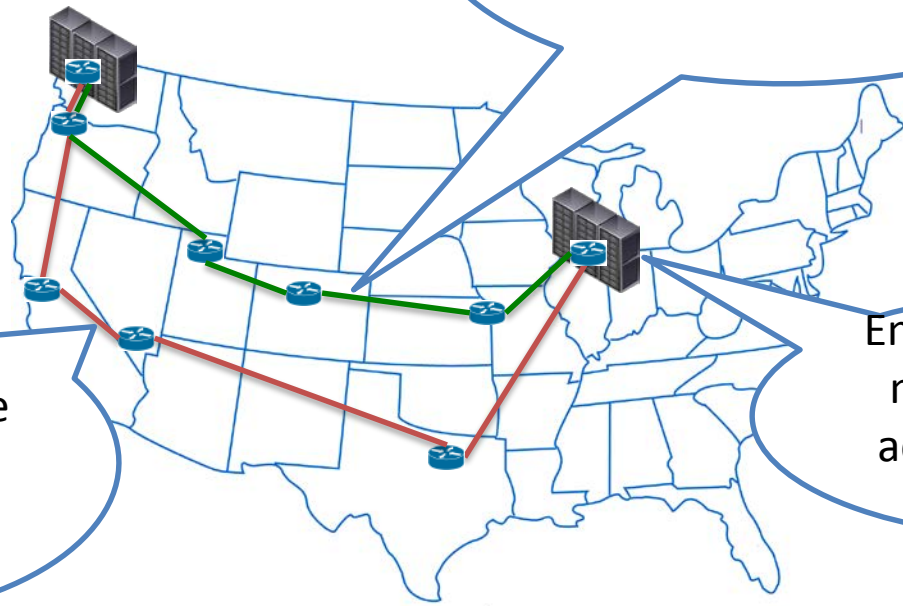

Goals for Today

- MinProbe: Accurate, Minimum Overhead, Available Bandwidth Estimation in High Speed Wired Networks
 - Ki Suh Lee, Erluo Li, ChiunLin Lim, Kevin Tang and Hakim Weatherspoon. In Proceedings of the 14th ACM SIGCOMM conference on Internet measurement (IMC), November 2014.

Available Bandwidth Estimation

- Basic building block
 - Network Protocol
 - Networked Systems
 - Distributed Systems

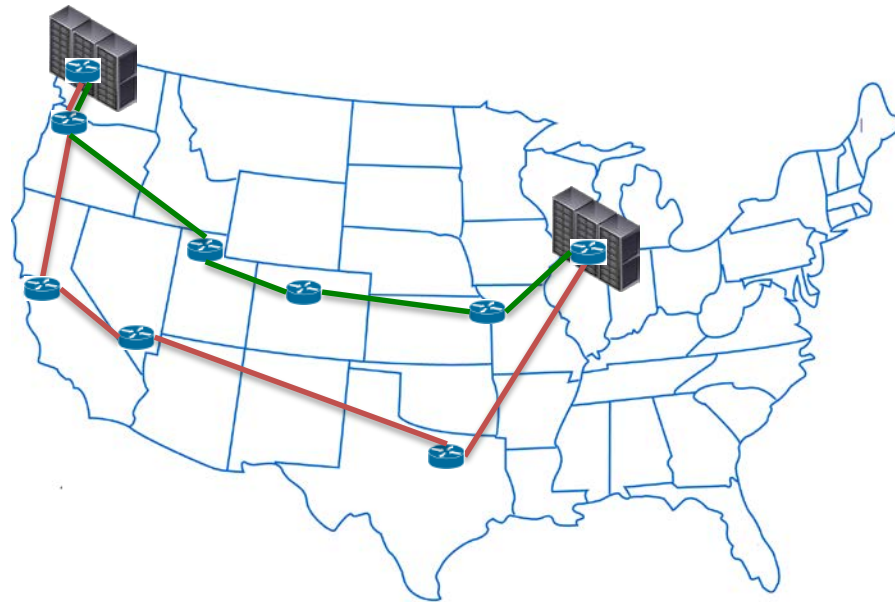

Which of the two paths has more available bandwidth?

How do I measure with minimum overhead?

End-to-end: How to measure without access to anything in the network?

Available Bandwidth Estimation

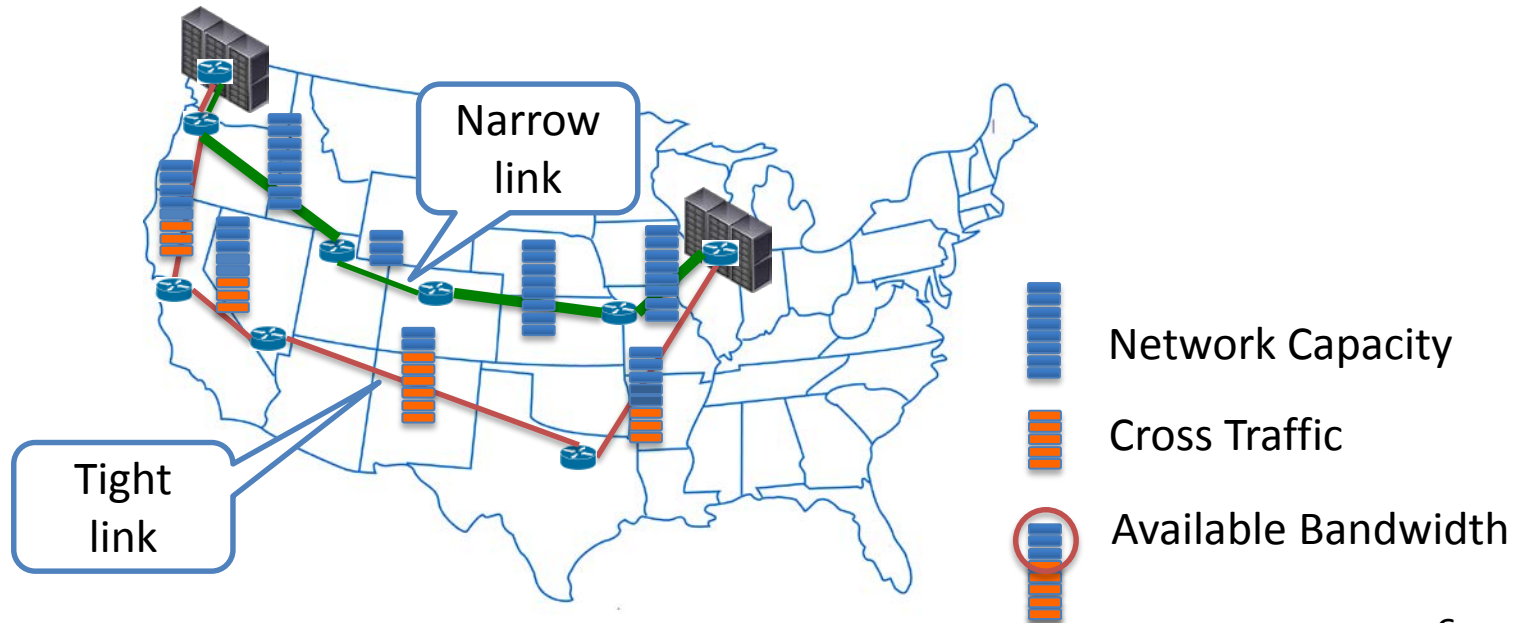

- Passive Measurement
 - Polling counters: Port Stats or Flow Stats
- Active Measurement
 - *Probe Packets*: Packet Pair or Packet Train

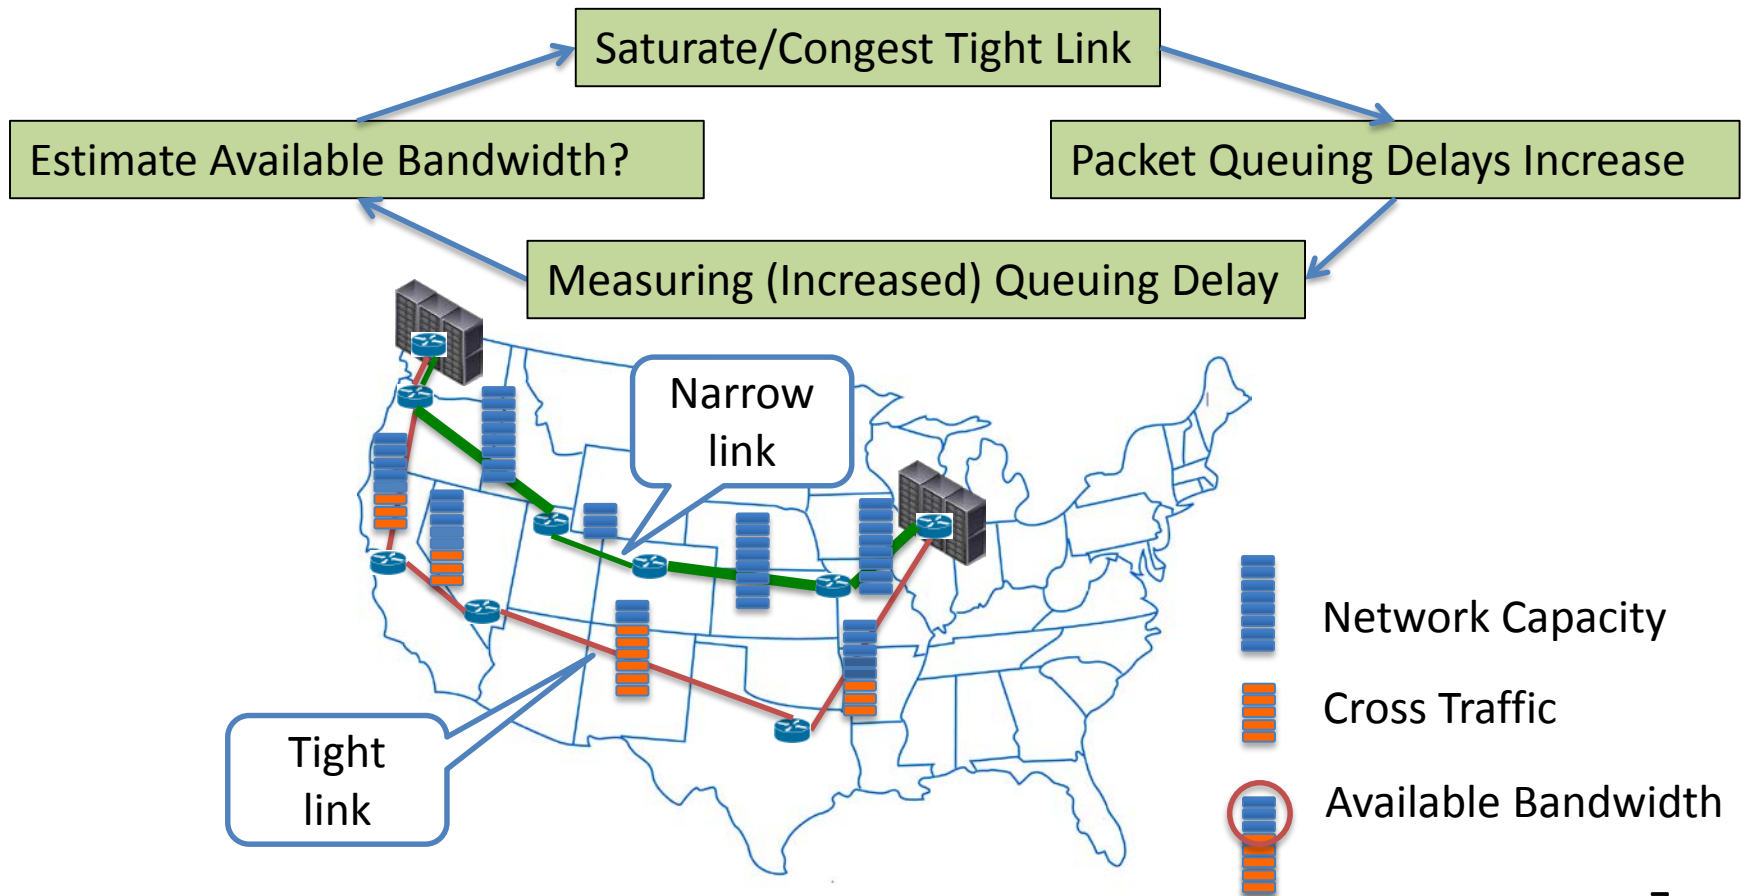

Active Measurement

- Narrow link: least capacity
- Tight link: least available bandwidth

Active Measurement

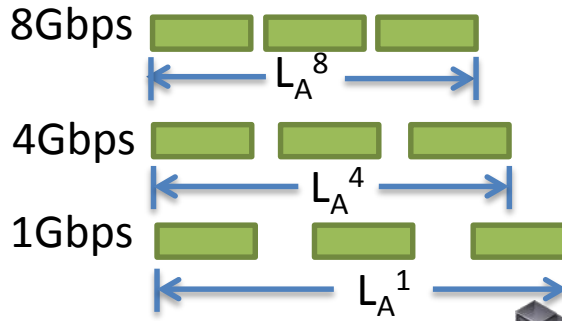

- Estimate available bandwidth by saturating the tight link

Active Measurement

- Estimate available bandwidth by saturating the tight link

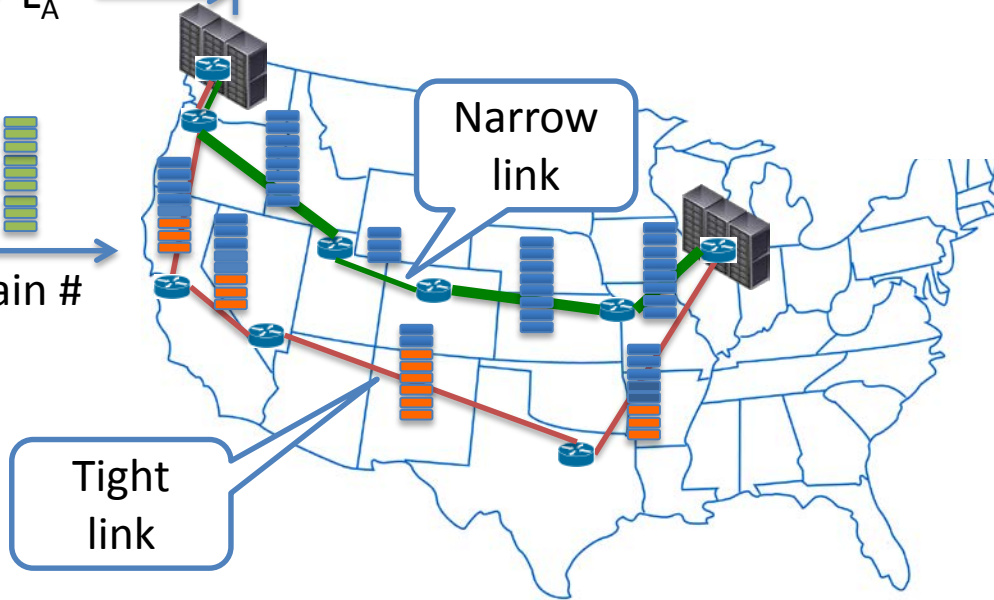

$L_A^8 < L_B^8$, congestion!

$L_A^4 == L_B^4$, no congestion

$L_A^1 == L_B^1$, no congestion

Increase in Queuing Delay Variance

By measuring the *increase in packet train length**, we can compute the *queuing delay* experienced, hence estimate the available bandwidth.

* Increase in packet train length == increase in sum of inter-packet gap

Limitations of Available Bandwidth Estimation

- Intrusive/Expensive
 - 100s of probe packets per packet train
- Inaccurate
 - Especially in high speed network
- Does not work well for bursty traffic

Goals of Available Bandwidth Estimation

- Cheap
 - Use as little probe packets as possible
- Accurate
 - How close is the estimation to the actual value
- Works for all traffic patterns

MinProbe: Bandwidth Estimation in PHY

- Cheap
 - Use as little probe packets as possible
 - ~~100s of probe packets per train~~ → 20 packets per train
 - Using application traffic as probe
- Accurate
 - How close is the estimation to the actual value
 - Error < 0.4Gbps, with a resolution of 0.1Gbps
- Works for all traffic patterns
 - Works with bursty cross traffic

Outline

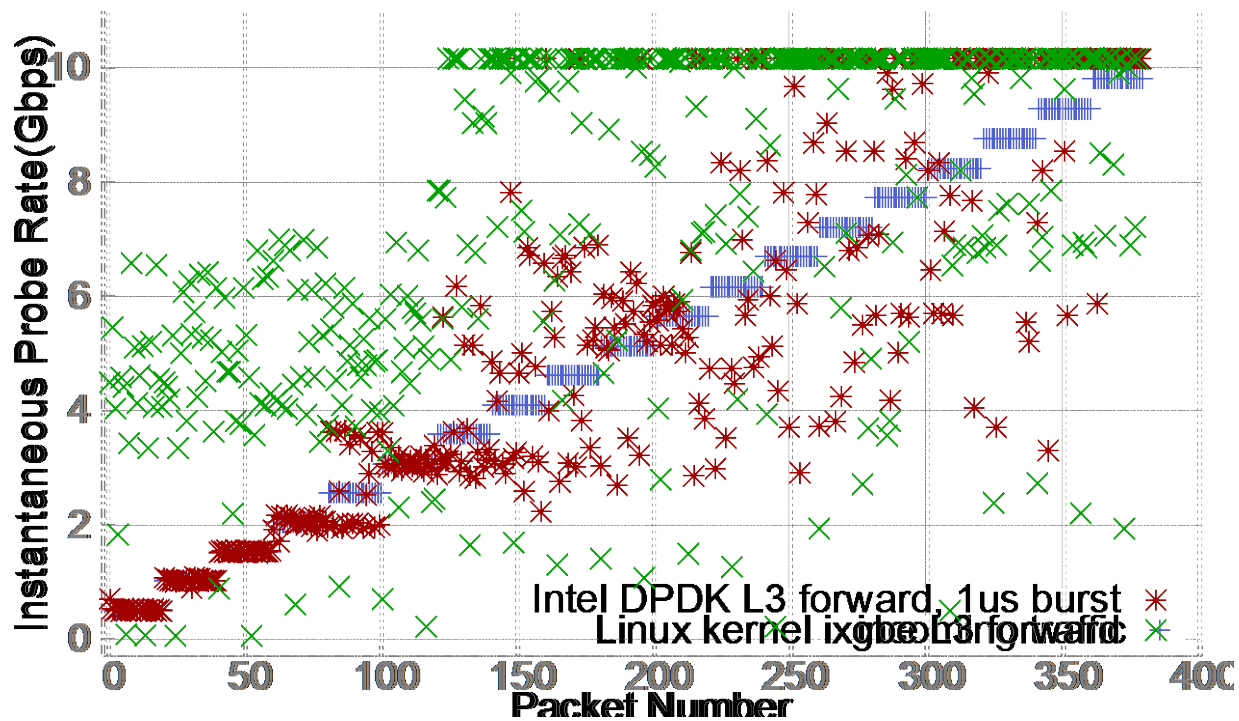

Challenges

Cannot Control at 100ps

Cannot Measure at 100ps

Challenges

Cannot Control at 100ps

Cannot Measure at 100ps

State-of-art (software) tools do **not** work at high speed because they cannot control and capture inter-packet spacing with required precision.

Outline

MinProbe: Better Accuracy

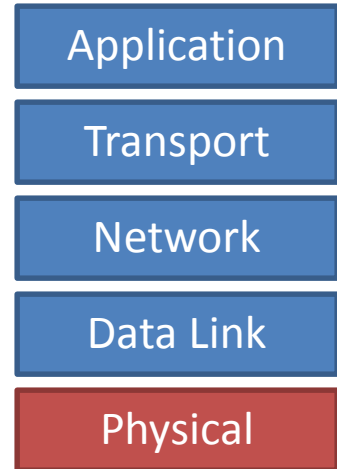

MinProbe: Better Accuracy

- Idle Characters (/I/)

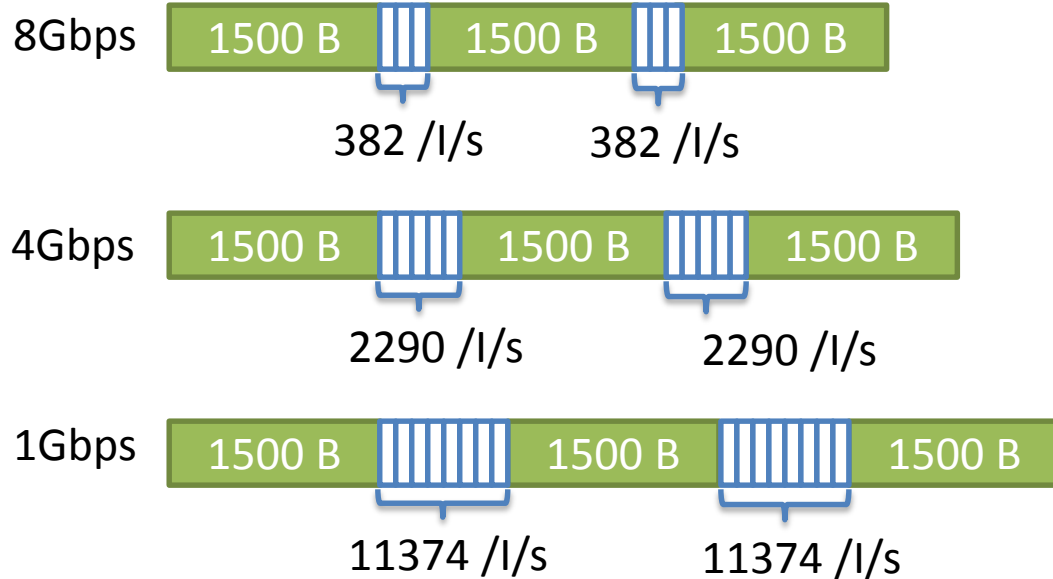

- Each bit ~100 picoseconds
- 7~8 bit special character in the physical layer
- 700~800 picoseconds to transmit
- Only in PHY

MinProbe: Better Accuracy

- Probe Generation

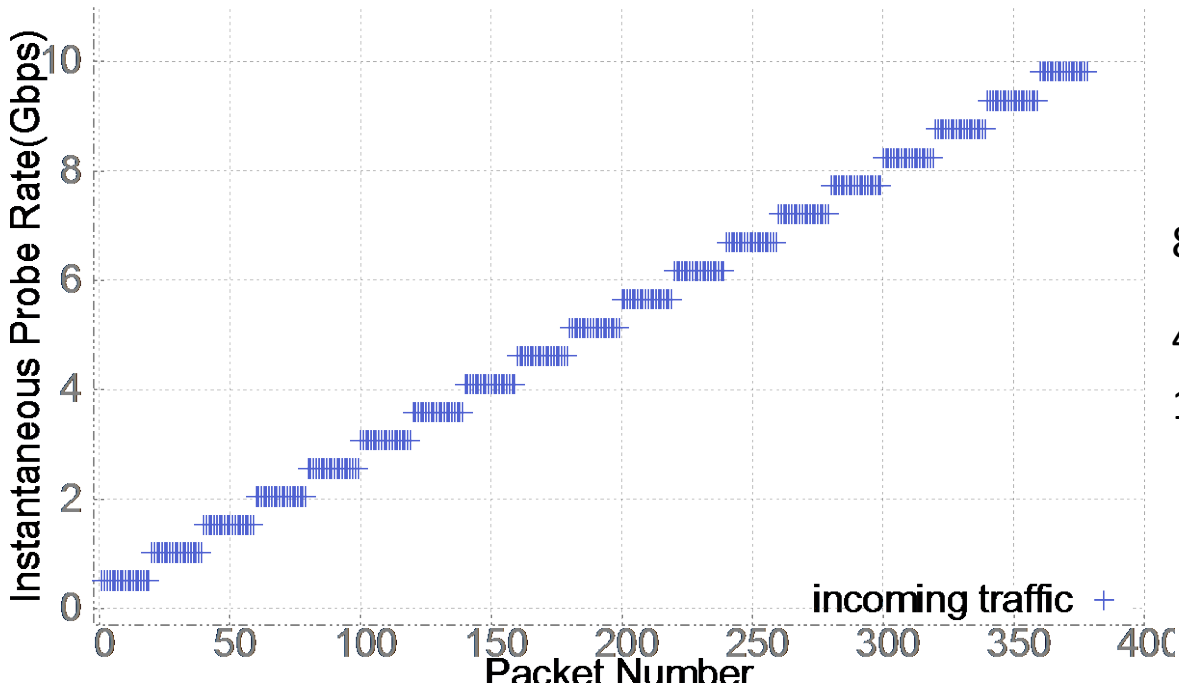

By modulating Inter-packet gap at PHY layer, we can generate accurate probe rate.

MinProbe: Better Accuracy

- Probe Generation

MinProbe: Better Accuracy

- With shared N and (Rmin, Rstep, Rmax)

- Emulate existing bandwidth estimation algorithm
 - Pathload, Pathchirp, SLoPS ...

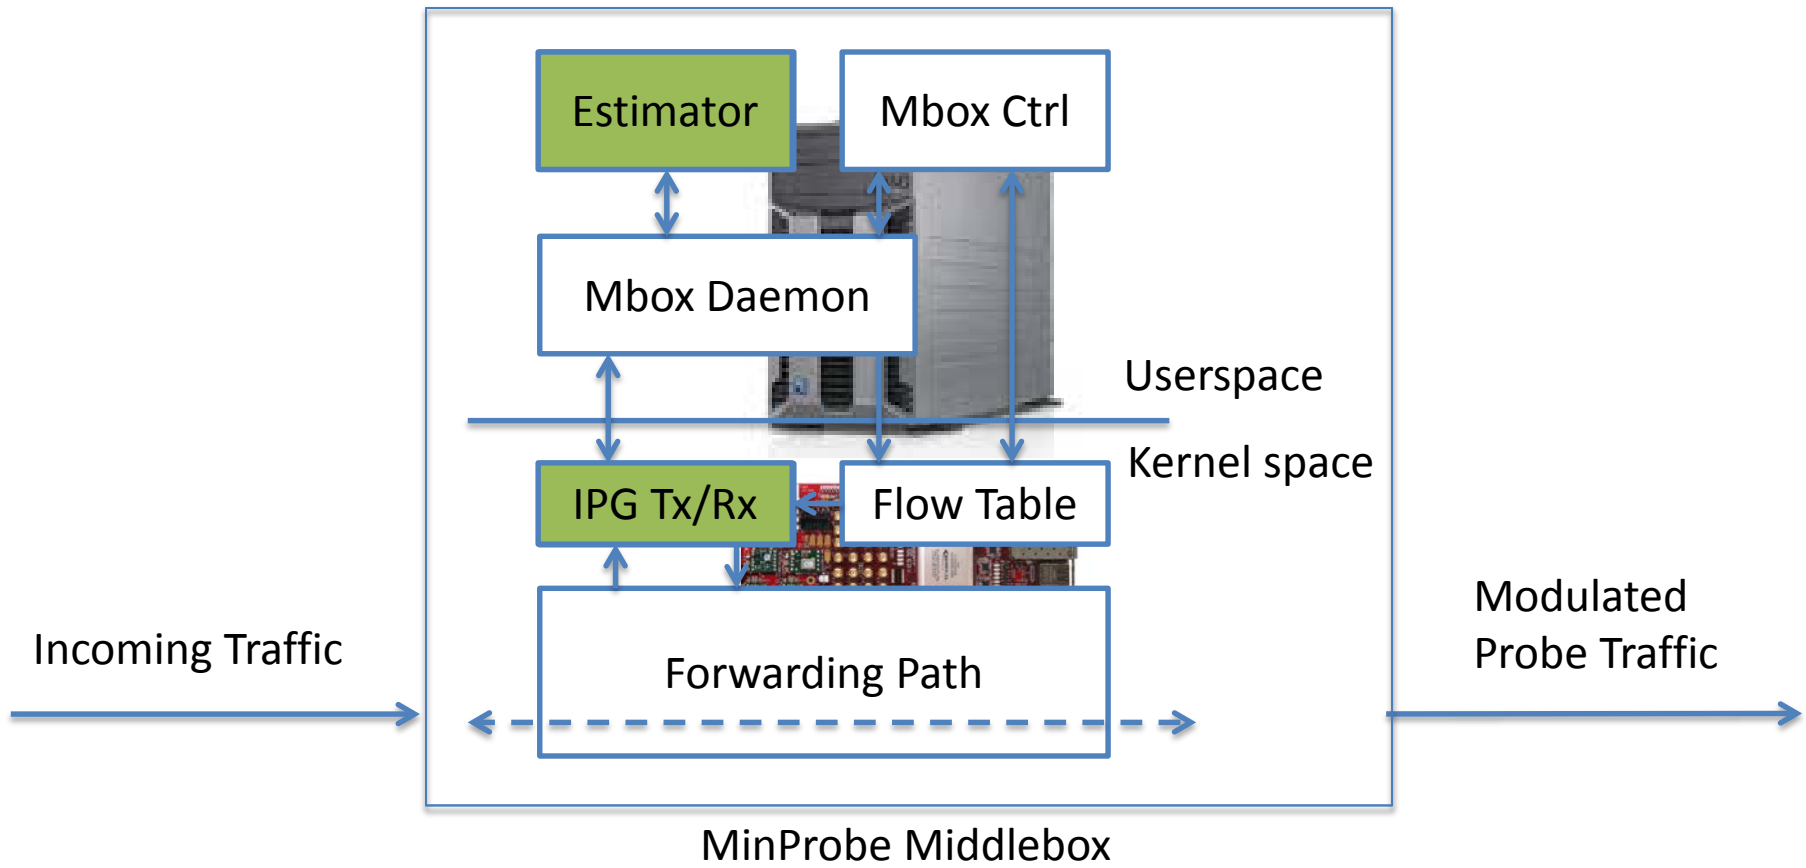

MinProbe: Low Overhead

- Reduce the # of probe packets required

# of probe packet per probe train	Error (%)
5	+15%
20	-1%
40	-2%
60	-3%
80	-3%
100 (Pathload)	-4%

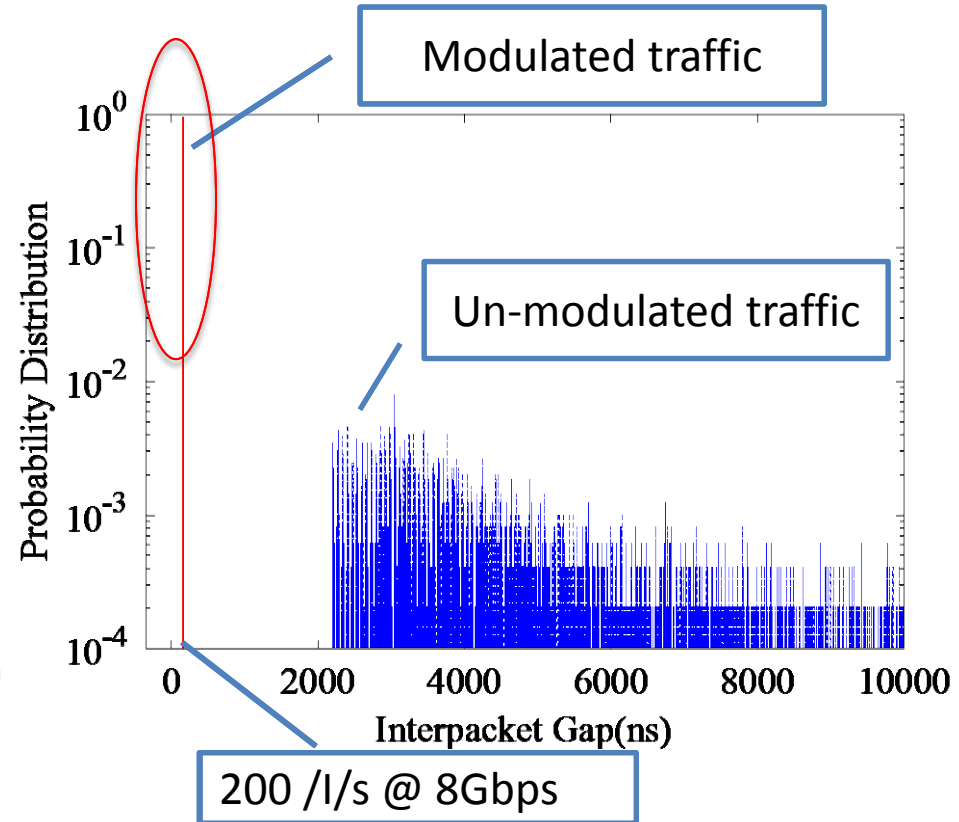

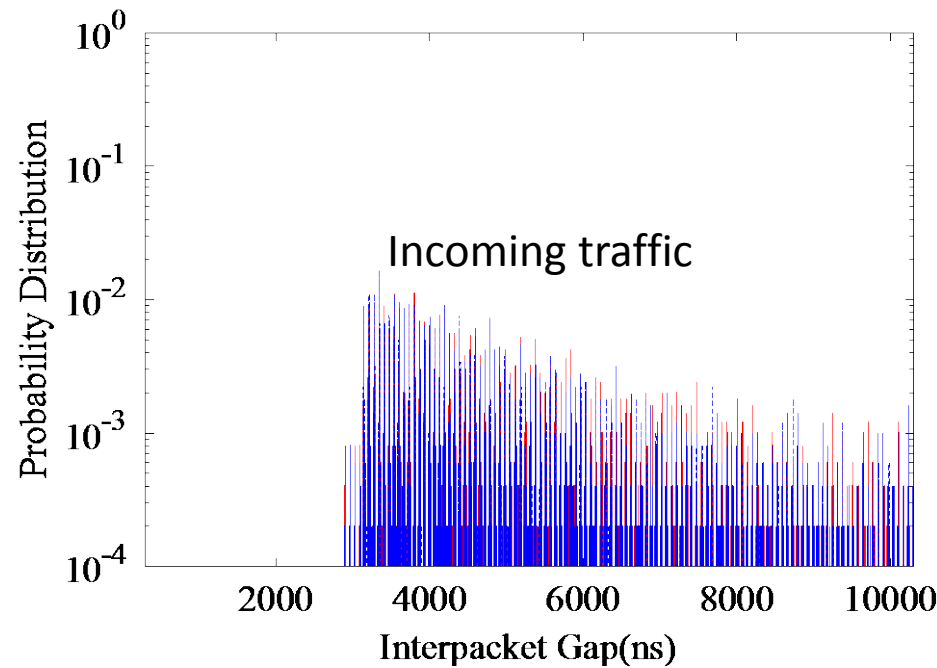

MinProbe: Very Low Overhead

MinProbe: Bandwidth Estimation in PHY

- Packet Size 792 Bytes

Outline

- Introduction
- Challenges
- Design: MinProbe
- **Evaluation**
- **Conclusion**

Questions:

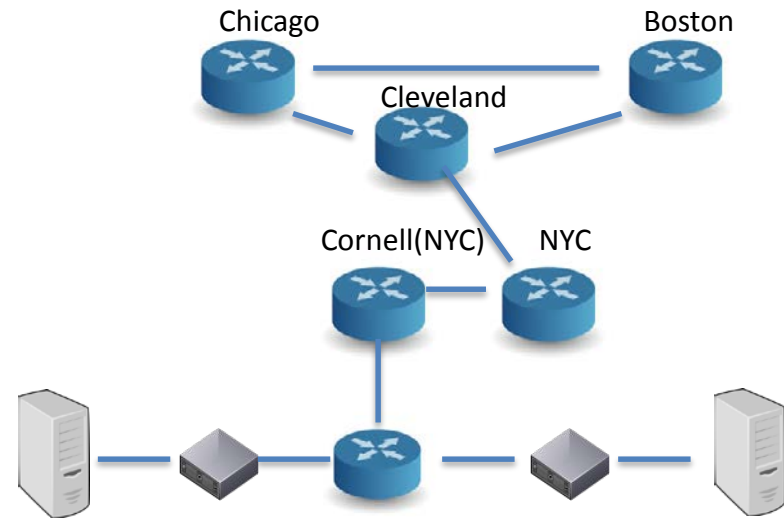

- Can MinProbe accurately estimate avail-bw at 10Gbps?
- Can existing estimation algorithms work with MinProbe?
- How do the following parameters affect accuracy?
 - Packet train length
 - probe packet size distribution
 - cross packet size distribution
 - cross packet burstiness
- Does MinProbe work in the wild, Internet?
- Does MinProbe work in rate limiting environments?

Experiment Setup

Controlled Environment

National Lambda Rail

MinProbe: Can we measure at 10Gbps?

- Cross Traffic
- Probe Traffic

MinProbe: Can we measure at 10Gbps?

- Cross Traffic
- Probe Traffic

MinProbe: Can we measure at 10Gbps?

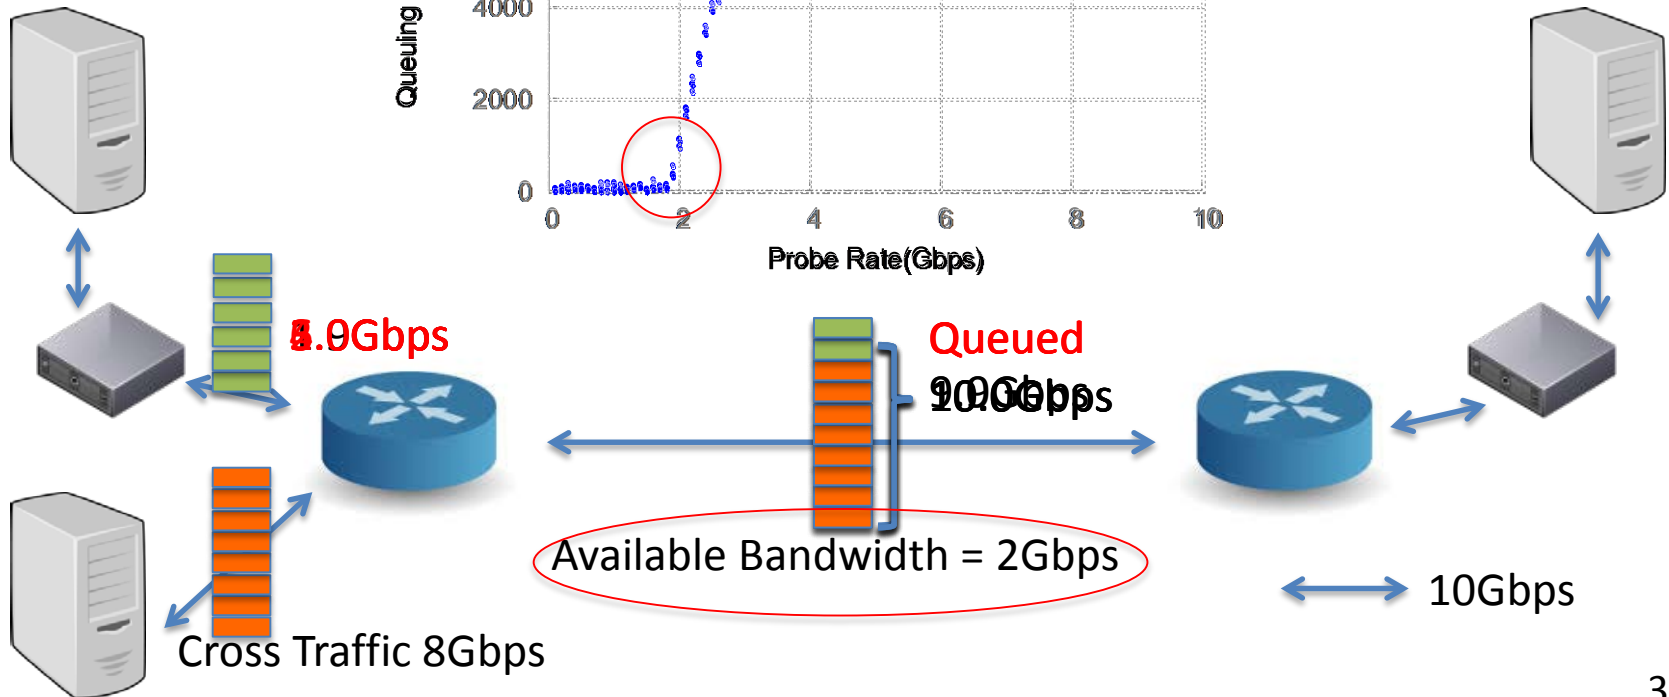

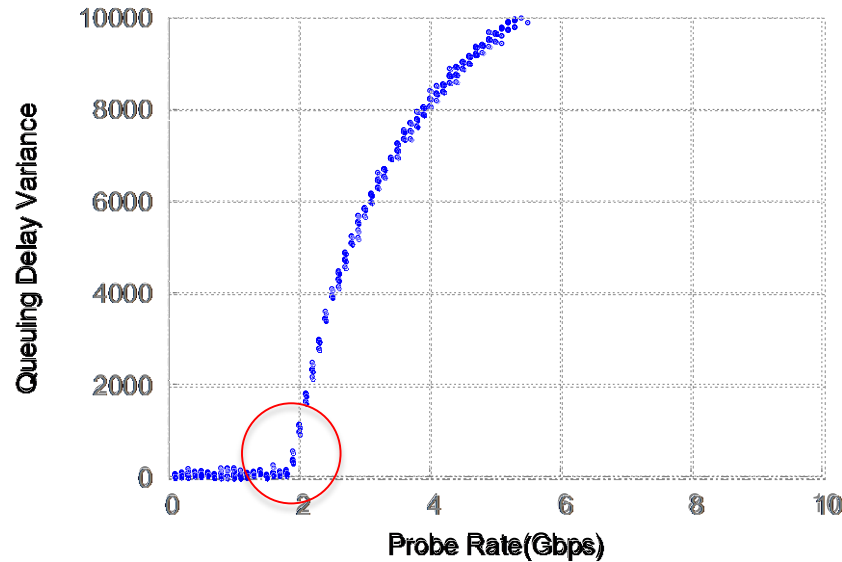

MinProbe: Can we measure at 10Gbps?

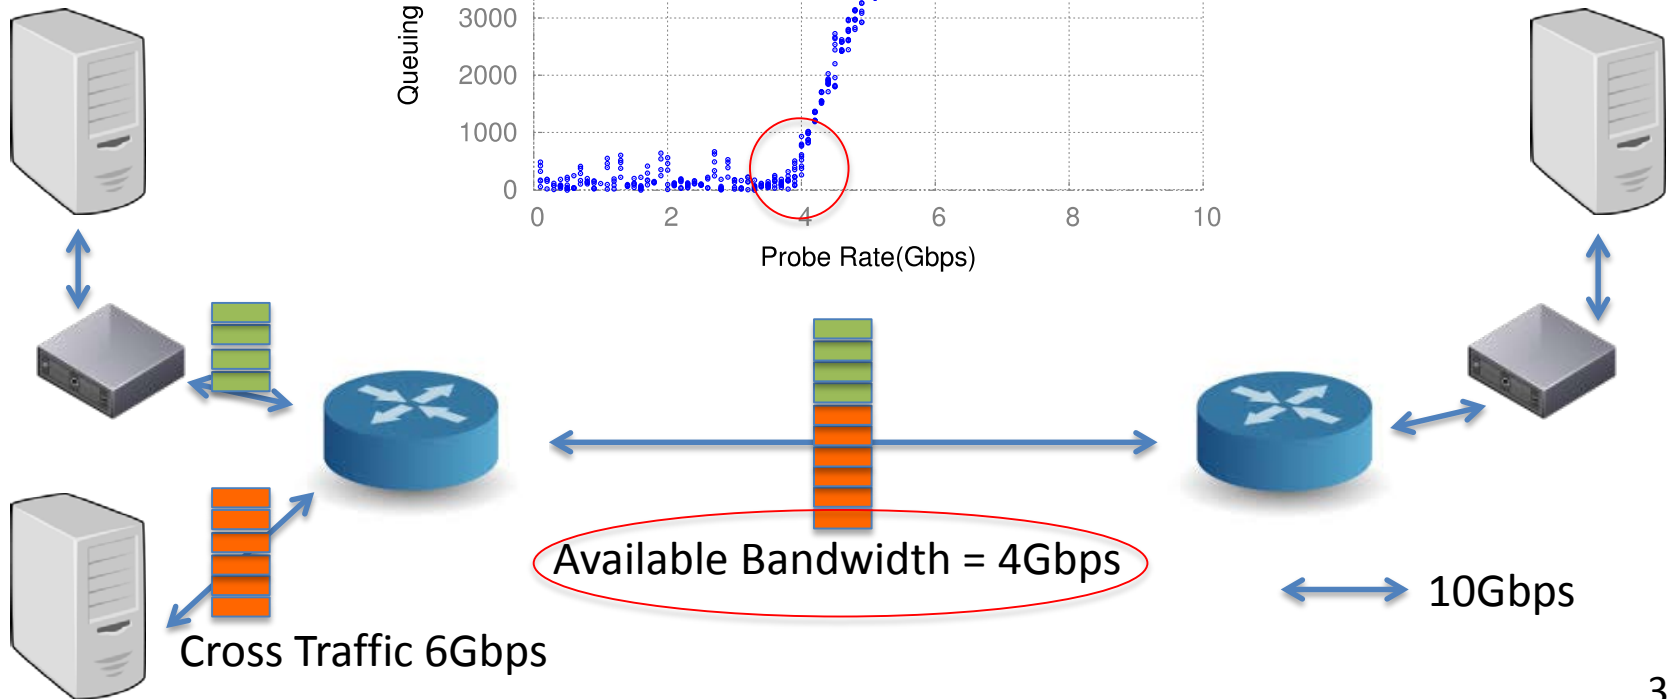

MinProbe: Can we measure at 10Gbps?

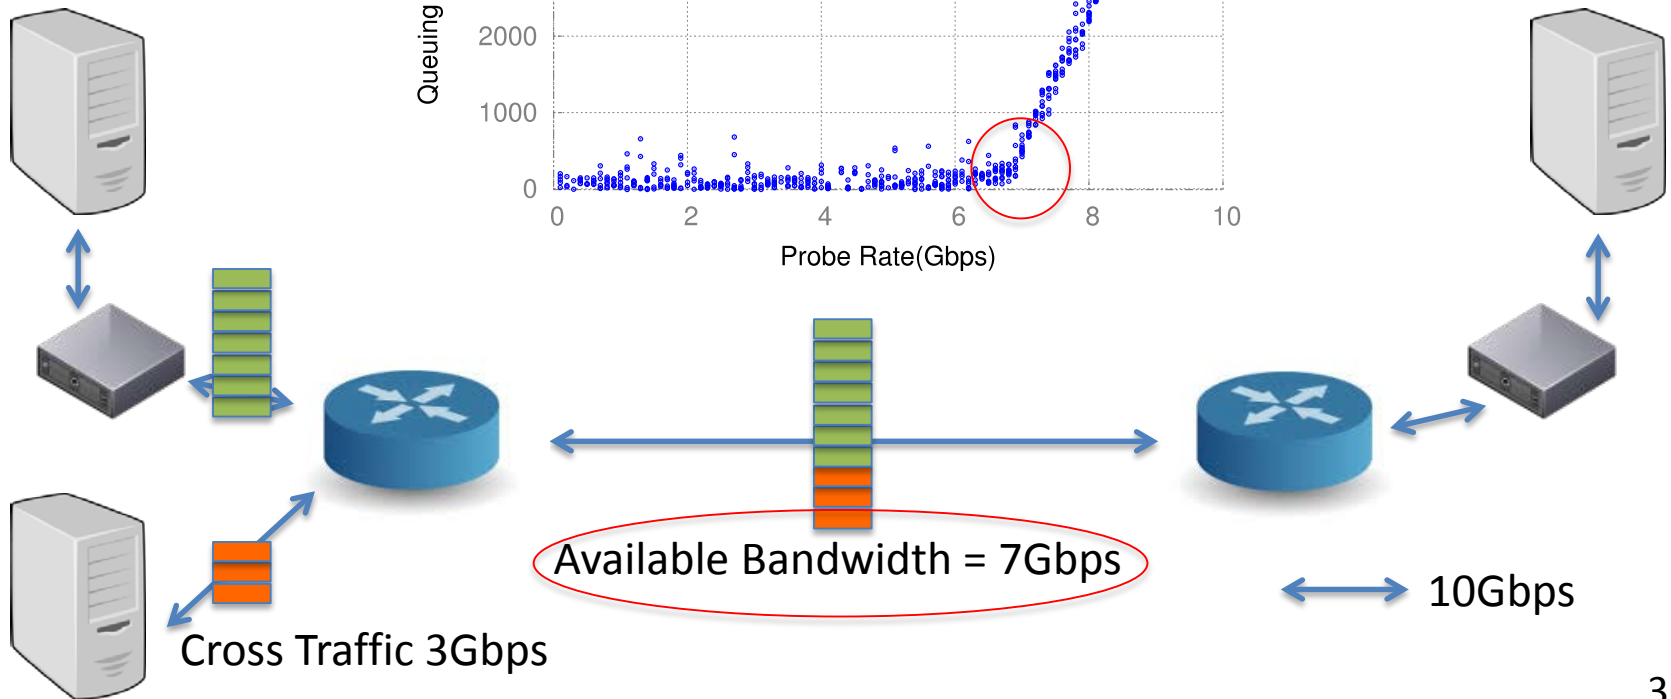

MinProbe: Can we measure at 10Gbps?

MinProbe: Can we measure at 10Gbps?

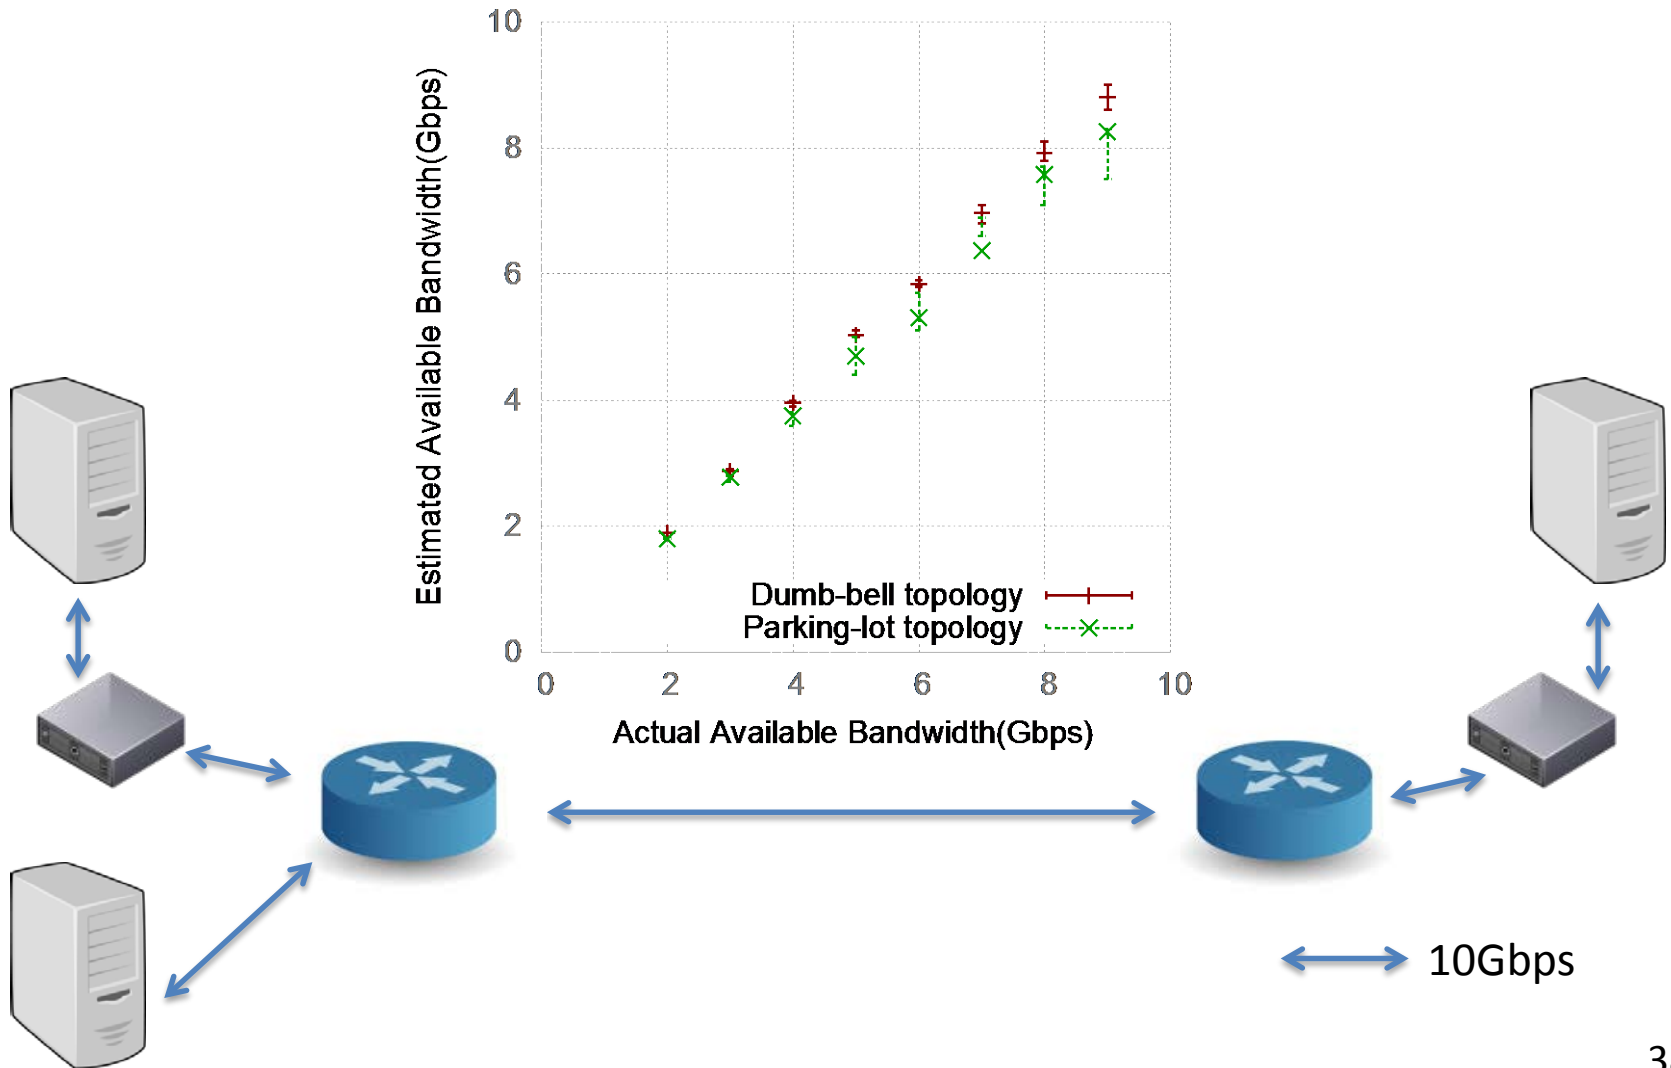

MinProbe: Can we measure at 10Gbps?

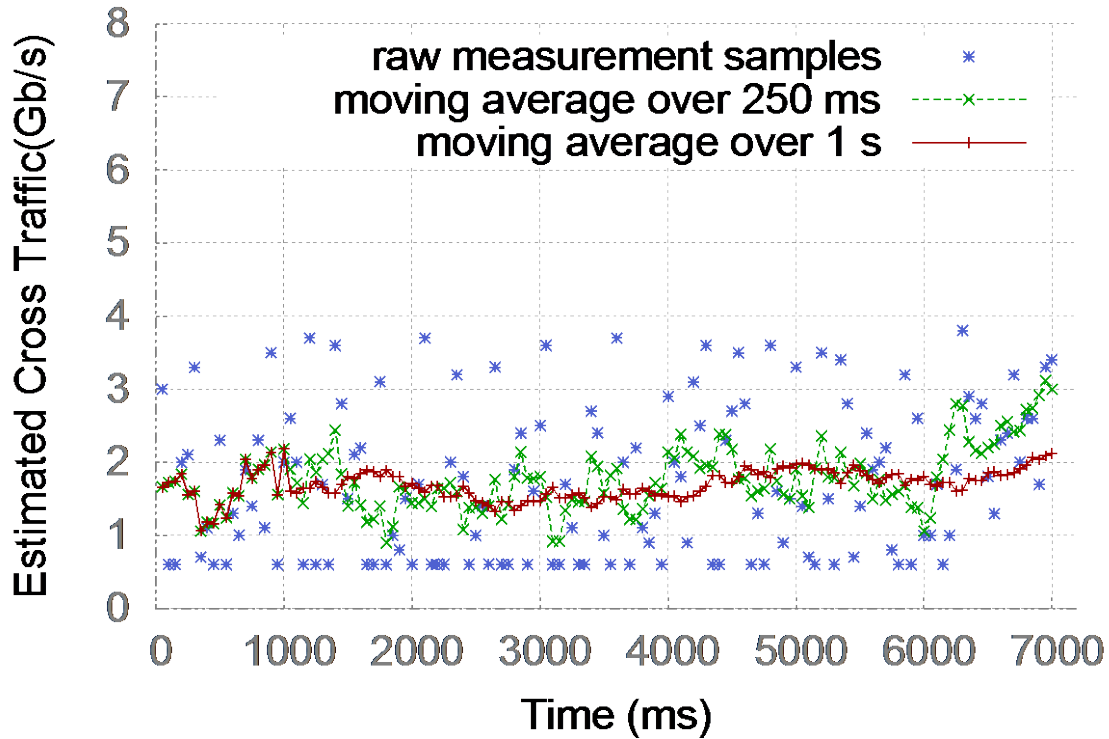

MinProbe: Can we measure at 10Gbps?

MinProbe: Can we measure at 10Gbps?

MinProbe: National Lambda Rail

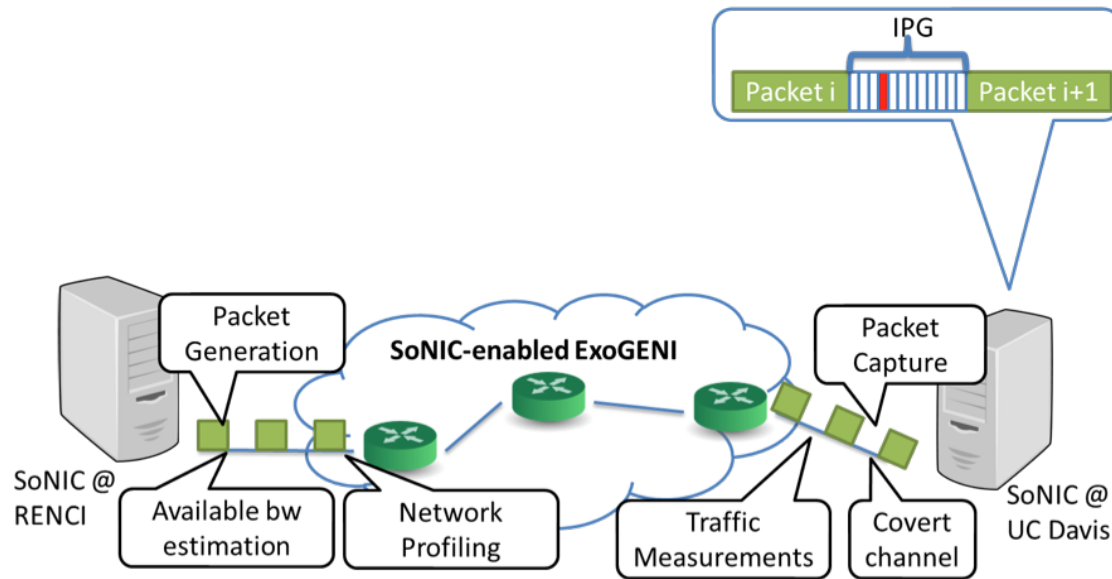

Questions:

- Can MinProbe accurately estimate avail-bw at 10Gbps?
- Can existing estimation algorithms work with MinProbe?
- How do the following parameters affect accuracy?
 - Packet train length
 - probe packet size distribution
 - cross packet size distribution
 - cross packet burstiness
- Does MinProbe work in the wild, Internet?
- Does MinProbe work in rate limiting environments?

MinProbe: In rate limiting environment?

- Rate Limiters may be an issue? **No**

- Provisioned 1Gbps virtual network
- If the probe train is less than 1200 packets, no packet loss

Outline

Conclusion

- Modulation of probe packets in PHY
- Accurate control & measure of packet timing
- Enabled available bandwidth estimation in 10Gbps

Accurate, Minimum Overhead, Available Bandwidth
Estimation in High Speed Wired Networks

Before Next time

- Project Interim report
 - **Due Monday, November 24.**
 - And meet with groups, TA, and professor
- Fractus Upgrade: Should be back online
- ***Required review and reading for Monday, November 17***
