

# CS5670: Computer Vision

Noah Snavely

## Backpropagation

# Readings

- Stochastic Gradient Descent & Backpropagation
  - <http://cs231n.github.io/optimization-1/>
  - <http://cs231n.github.io/optimization-2/>

# Announcements

- Project 4 (Stereo) due tomorrow, April 26, 2018, by 11:59pm
- Quiz 3 in class, Monday, 4/30, first 10 minutes of class
- Final exam in class, May 9
  - Will provide some study materials

# Today

- How to train CNNs
  - Backpropagation algorithm
  - Best practices for training deep CNNs
  - Data augmentation

# Last time: neural networks

- Computation graph for a 2-layer neural network

*Neuron or unit*

# Last time: convolutional neural networks

Illustration of LeCun et al. 1998 from CS231n 2017 Lecture 1

# Last time: convolutional layers

For example, if we had 6 5x5 filters, we'll get 6 separate activation maps:

We stack these up to get a “new image” of size 28x28x6!

# Last time: convolutional neural networks

preview:

A closer look at spatial dimensions:

7x7 input (spatially)  
assume 3x3 filter  
applied **with stride 3?**

**doesn't fit!**  
cannot apply 3x3 filter on  
7x7 input with stride 3.

Output size:  
 **$(N - F) / \text{stride} + 1$**

e.g.  $N = 7, F = 3$ :

stride 1  $\Rightarrow (7 - 3) / 1 + 1 = 5$

stride 2  $\Rightarrow (7 - 3) / 2 + 1 = 3$

stride 3  $\Rightarrow (7 - 3) / 3 + 1 = 2.33 \text{ :}\backslash$

# In practice: Common to zero pad the border

|   |   |   |   |   |   |  |  |  |
|---|---|---|---|---|---|--|--|--|
| 0 | 0 | 0 | 0 | 0 | 0 |  |  |  |
| 0 |   |   |   |   |   |  |  |  |
| 0 |   |   |   |   |   |  |  |  |
| 0 |   |   |   |   |   |  |  |  |
| 0 |   |   |   |   |   |  |  |  |
|   |   |   |   |   |   |  |  |  |
|   |   |   |   |   |   |  |  |  |
|   |   |   |   |   |   |  |  |  |
|   |   |   |   |   |   |  |  |  |
|   |   |   |   |   |   |  |  |  |

e.g. input 7x7

**3x3** filter, applied with **stride 1**

**pad with 1 pixel** border => what is the output?

(recall:)

$(N - F) / \text{stride} + 1$

# In practice: Common to zero pad the border

|   |   |   |   |   |   |  |  |  |
|---|---|---|---|---|---|--|--|--|
| 0 | 0 | 0 | 0 | 0 | 0 |  |  |  |
| 0 |   |   |   |   |   |  |  |  |
| 0 |   |   |   |   |   |  |  |  |
| 0 |   |   |   |   |   |  |  |  |
| 0 |   |   |   |   |   |  |  |  |
|   |   |   |   |   |   |  |  |  |
|   |   |   |   |   |   |  |  |  |
|   |   |   |   |   |   |  |  |  |
|   |   |   |   |   |   |  |  |  |

e.g. input 7x7

**3x3** filter, applied with **stride 1**

**pad with 1 pixel** border => what is the output?

**7x7 output!**

## In practice: Common to zero pad the border

|   |   |   |   |   |   |  |  |  |
|---|---|---|---|---|---|--|--|--|
| 0 | 0 | 0 | 0 | 0 | 0 |  |  |  |
| 0 |   |   |   |   |   |  |  |  |
| 0 |   |   |   |   |   |  |  |  |
| 0 |   |   |   |   |   |  |  |  |
| 0 |   |   |   |   |   |  |  |  |
|   |   |   |   |   |   |  |  |  |
|   |   |   |   |   |   |  |  |  |
|   |   |   |   |   |   |  |  |  |
|   |   |   |   |   |   |  |  |  |

e.g. input 7x7

**3x3** filter, applied with **stride 1**

**pad with 1 pixel** border => what is the output?

**7x7 output!**

in general, common to see CONV layers with stride 1, filters of size  $F \times F$ , and zero-padding with  $(F-1)/2$ . (will preserve size spatially)

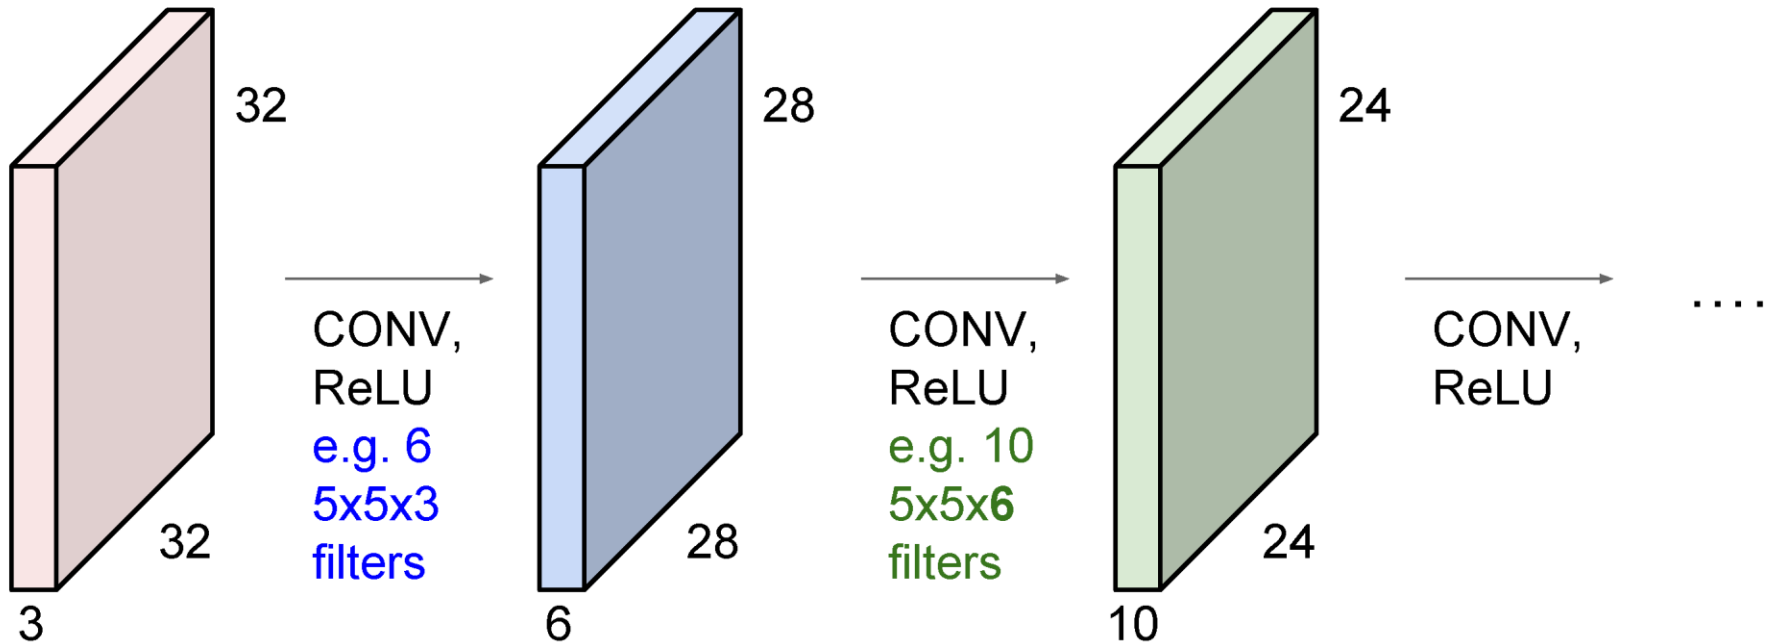

e.g.  $F = 3 \Rightarrow$  zero pad with 1

$F = 5 \Rightarrow$  zero pad with 2

$F = 7 \Rightarrow$  zero pad with 3

## Remember back to...

E.g. 32x32 input convolved repeatedly with 5x5 filters shrinks volumes spatially! (32 -> 28 -> 24 ...). Shrinking too fast is not good, doesn't work well.

Examples time:

Input volume: **32x32x3**

10 5x5 filters with stride 1, pad 2

Output volume size: ?

Examples time:

Input volume: **32x32x3**

**10** **5x5** filters with stride **1**, pad **2**

Output volume size:

$(32+2*2-5)/1+1 = 32$  spatially, so

**32x32x10**

Examples time:

Input volume: **32x32x3**

10 5x5 filters with stride 1, pad 2

Number of parameters in this layer?

Examples time:

Input volume: **32x32x3**

**10** **5x5** filters with stride 1, pad 2

Number of parameters in this layer?

each filter has  $5*5*3 + 1 = 76$  params

(+1 for bias)

$\Rightarrow 76*10 = 760$

(btw, 1x1 convolution layers make perfect sense)

1x1 CONV  
with 32 filters

→

(each filter has size  
1x1x64, and performs a  
64-dimensional dot  
product)

# Pooling layer

- makes the representations smaller and more manageable
- operates over each activation map independently:

# MAX POOLING

Single depth slice

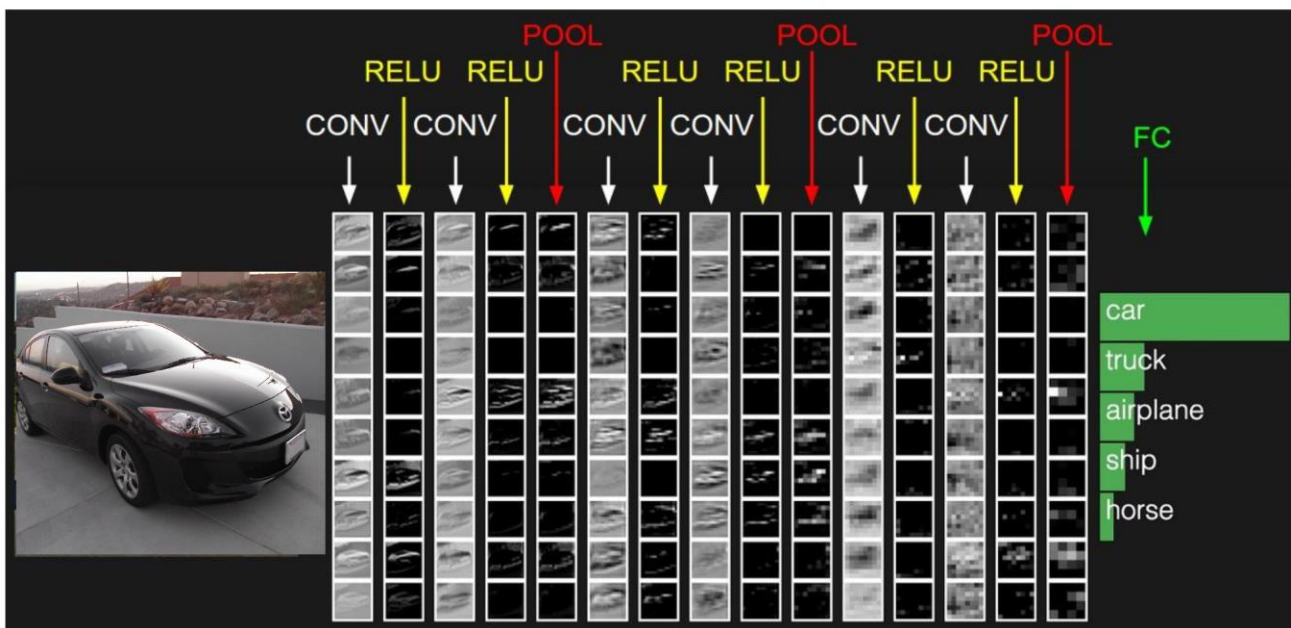

max pool with 2x2 filters  
and stride 2

# Fully Connected Layer (FC layer)

- Contains neurons that connect to the entire input volume, as in ordinary Neural Networks

# [ConvNetJS demo: training on CIFAR-10]

## ConvNetJS CIFAR-10 demo

### Description

This demo trains a Convolutional Neural Network on the [CIFAR-10 dataset](#) in your browser, with nothing but Javascript. The state of the art on this dataset is about 90% accuracy and human performance is at about 94% (not perfect as the dataset can be a bit ambiguous). I used [this python script](#) to parse the [original files](#) (python version) into batches of images that can be easily loaded into page DOM with img tags.

This dataset is more difficult and it takes longer to train a network. Data augmentation includes random flipping and random image shifts by up to 2px horizontally and vertically.

By default, in this demo we're using Adadelata which is one of per-parameter adaptive step size methods, so we don't have to worry about changing learning rates or momentum over time. However, I still included the text fields for changing these if you'd like to play around with SGD+Momentum trainer.

Report questions/bugs/suggestions to [@karpathy](#).

<https://cs.stanford.edu/people/karpathy/convnetjs/demo/cifar10.html>

# Summary of CNNs

- ConvNets stack CONV, POOL, FC layers
- Trend towards smaller filters and deeper architectures
- Trend towards getting rid of POOL/FC layers (just CONV)
- Typical architectures look like  
**[(CONV-RELU)\*N-POOL?]\*M-(FC-RELU)\*K, SOFTMAX**  
where N is usually up to ~5, M is large,  $0 \leq K \leq 2$ .
  - but recent advances such as ResNet/GoogLeNet challenge this paradigm

Questions?

# Bigger picture

- A convolutional neural network can be thought of as a function from images to class scores
  - With millions of adjustable weights...
  - ... leading to a very non-linear mapping from images to features / class scores.
  - We will set these weights based on classification accuracy on training data...
  - ... and hopefully our network will generalize to new images at test time

# Back to optimization

- Now we know what the structure of our function from images  $\rightarrow$  class scores is
- How do we learn the weights?
- Answer: Stochastic gradient descent
  - Requires that we compute the derivative of the training loss with respect to all weights

# Where we are

- Function  $f$  maps images to class scores

$$s = f(x; W) = \cancel{Wx} \quad f \text{ is a deep CNN}$$

- Loss function maps class scores to “badness”

$$L_i = -\log \left( \frac{e^{f_{y_i}}}{\sum_j e^{f_j}} \right) \quad \text{Cross-entropy loss}$$

$$L = \frac{1}{N} \sum_{i=1}^N L_i + \sum_k W_k^2 \quad \text{Data loss + regularization}$$

want  $\nabla_W L$  (gradient of  $L$  w.r.t.  $W$ , computed analytically)

# Computation graphs

Forward pass: compute loss using current weights

Backwards pass: compute gradients of loss w.r.t. weights, then update the weights (backpropagation algorithm)

Backpropagation: a simple example

$$f(x, y, z) = (x + y)z$$

Backpropagation: a simple example

$$f(x, y, z) = (x + y)z$$

e.g.  $x = -2, y = 5, z = -4$

Backpropagation: a simple example

$$f(x, y, z) = (x + y)z$$

e.g.  $x = -2, y = 5, z = -4$

$$q = x + y \quad \frac{\partial q}{\partial x} = 1, \frac{\partial q}{\partial y} = 1$$

$$f = qz \quad \frac{\partial f}{\partial q} = z, \frac{\partial f}{\partial z} = q$$

Want:  $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}$

Backpropagation: a simple example

$$f(x, y, z) = (x + y)z$$

e.g.  $x = -2, y = 5, z = -4$

$$q = x + y \quad \frac{\partial q}{\partial x} = 1, \frac{\partial q}{\partial y} = 1$$

$$f = qz \quad \frac{\partial f}{\partial q} = z, \frac{\partial f}{\partial z} = q$$

Want:  $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}$

$$\frac{\partial f}{\partial f}$$

Backpropagation: a simple example

$$f(x, y, z) = (x + y)z$$

e.g.  $x = -2, y = 5, z = -4$

$$q = x + y \quad \frac{\partial q}{\partial x} = 1, \frac{\partial q}{\partial y} = 1$$

$$f = qz \quad \frac{\partial f}{\partial q} = z, \frac{\partial f}{\partial z} = q$$

Want:  $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}$

$$\frac{\partial f}{\partial f}$$

Backpropagation: a simple example

$$f(x, y, z) = (x + y)z$$

e.g.  $x = -2, y = 5, z = -4$

$$q = x + y \quad \frac{\partial q}{\partial x} = 1, \frac{\partial q}{\partial y} = 1$$

$$f = qz \quad \frac{\partial f}{\partial q} = z, \frac{\partial f}{\partial z} = q$$

Want:  $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}$

$$\frac{\partial f}{\partial z}$$

Backpropagation: a simple example

$$f(x, y, z) = (x + y)z$$

e.g.  $x = -2, y = 5, z = -4$

$$q = x + y \quad \frac{\partial q}{\partial x} = 1, \frac{\partial q}{\partial y} = 1$$

$$f = qz \quad \frac{\partial f}{\partial q} = z, \frac{\partial f}{\partial z} = q$$

Want:  $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}$

$$\frac{\partial f}{\partial z}$$

Backpropagation: a simple example

$$f(x, y, z) = (x + y)z$$

e.g.  $x = -2, y = 5, z = -4$

$$q = x + y \quad \frac{\partial q}{\partial x} = 1, \frac{\partial q}{\partial y} = 1$$

$$f = qz \quad \frac{\partial f}{\partial q} = z, \frac{\partial f}{\partial z} = q$$

Want:  $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}$

$$\frac{\partial f}{\partial q}$$

Backpropagation: a simple example

$$f(x, y, z) = (x + y)z$$

e.g.  $x = -2, y = 5, z = -4$

$$q = x + y \quad \frac{\partial q}{\partial x} = 1, \frac{\partial q}{\partial y} = 1$$

$$f = qz \quad \frac{\partial f}{\partial q} = z, \frac{\partial f}{\partial z} = q$$

Want:  $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}$

$$\frac{\partial f}{\partial q}$$

Backpropagation: a simple example

$$f(x, y, z) = (x + y)z$$

$$\text{e.g. } x = -2, y = 5, z = -4$$

$$q = x + y \quad \frac{\partial q}{\partial x} = 1, \frac{\partial q}{\partial y} = 1$$

$$f = qz \quad \frac{\partial f}{\partial q} = z, \frac{\partial f}{\partial z} = q$$

Want:  $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}$

$$\frac{\partial f}{\partial y}$$

Chain rule:

$$\frac{\partial f}{\partial y} = \frac{\partial f}{\partial q} \frac{\partial q}{\partial y}$$

output vector

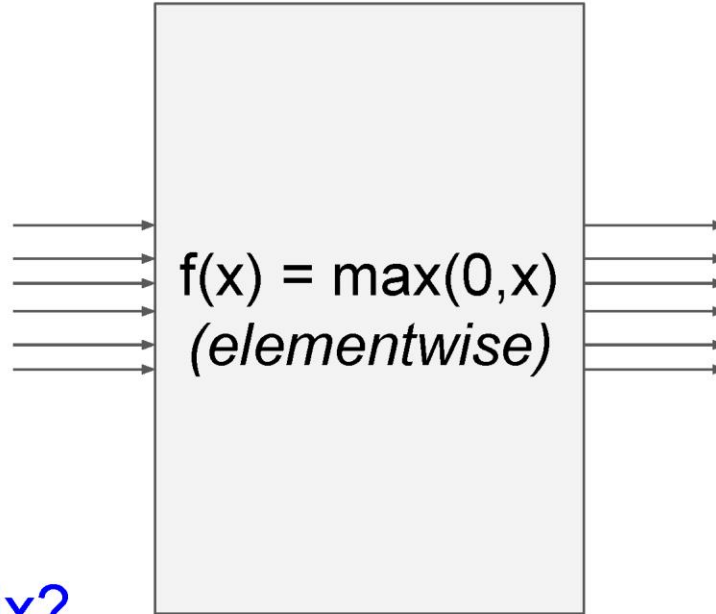

Q: what is the  
size of the  
Jacobian matrix?  
[4096 x 4096!]

Q2: what does it  
look like?

# Summary so far...

- neural nets will be very large: impractical to write down gradient formula by hand for all parameters
- **backpropagation** = recursive application of the chain rule along a computational graph to compute the gradients of all inputs/parameters/intermediates
- implementations maintain a graph structure, where the nodes implement the **forward()** / **backward()** API
- **forward**: compute result of an operation and save any intermediates needed for gradient computation in memory
- **backward**: apply the chain rule to compute the gradient of the loss function with respect to the inputs
