Downward-entailing operators

Downward-entailing operators invert the default monotonicity, allowing one to "reason from sets to subsets" [van der Wouden, 1997]

Downward-entailing operators

Why?

Linguistic importance:

DE operators play "an extremely important role in natural language" [van der Wouden, 1997; van Benthem, 1986; Hoekesema, 1986; Dowty, 1994; Sánchez Valencia, 1991]

Textual Entailment:

Textual Entailment systems that approach monotonicity rely on relatively small hand-annotated lists of DE operators.

[Nairn et al.; 2006, MacCartney and Manning, 2008; Bar-Haim et al., 2008.]

Prevalence:

Estimate (post-hoc) that at least 6% of newswire sentences contain a non-trivial DE operator (excluded: 'not', 'no', 'none', 'few', etc.).
