1. Introduction

The Dialogic Audio Conferencing Package supports the Dialogic DCB/SC product family. The DCB/SC series includes the following boards:

DCB/320SC  32 conferencing resources
DCB/640SC  64 conferencing resources
DCB/960SC  96 conferencing resources

Each product in the DCB/SC series contains one, two, or three DSP(s). Each Digital Signal Processor (DSP) supports up to 32 conferees, for a maximum of 96 (3 sets of 32) conferencing resources.

1.1. Organization of this Guide

This Software Reference is organized as follows:

Chapter 1 presents an overview of the Dialogic Dialogic Audio Conferencing technology and provides a description of the DCB/SC board.

Chapter 2 provides an overview of the DCB/SC library functions. A detailed description and a programming example for each function is found in Chapter 3.

Chapter 4 provides brief guidelines to use for developing applications using the library functions.

1.2. Dialogic Audio Conferencing Features

Dialogic Audio Conferencing provides the following features and benefits to your application:

- SCbus access to build high density systems — up to 1024 time slots.
- Conferencing of up to 32 conferees per conference, connected across the SCbus.
Dialogic Audio Conferencing Software Reference for Windows NT

- Monitoring feature enabling many participants to monitor a single conference.
- Coach/pupil feature allowing two selected conferees to establish a private subconference with respect to the overall conference.
- DTMF digit detection for any conferee, allowing the application to determine when or if any party has generated a DTMF digit.
- On-board digit detection for each party in the conference.
- Tone clamping to reduce the amount of DTMF tones heard in a conference.
- Volume control for any conferee by simply issuing a pre-programmed DTMF digit.
- Automatic gain control (AGC) for all conferees.
- Active talker indication to determine which conferees in any given conference are currently talking.

1.3. Software Features

Each DCB/SC board has one or more DSPs. Conferences are associated with DSPs and may not span DSPs. Each DSP has 32 resources. Every time a conferee is added to a conference, a resource is used. When the conferee is removed from a conference and/or a conference is deleted, all associated resources are freed.

An application has the flexibility to associate conferences with any desired DSP. This allows for load balancing and better control over resources. Applications associate conferences with DSPs using a DSP device handle. DSP device handles are obtained using the `dcb_open()` function.

Examples of valid DSP names used in `dcb_open()` are shown below:

dcbBxD1, dcbBxD2, dcbBxD3

where x indicates the board number associated with the DCB/SC board.
1. Introduction

1.3.1. Active Talkers

Active talkers are those conferees providing “non-silence” energy. The DCB/SC board can provide indication of the active talkers in a specified conference.

To retrieve active talkers, turn on the active talker feature by setting MSG_ACTID to ACTID_ON using the `dcb_setbrdparm()` function. Then, retrieve active talkers using the `dcb_gettalkers()` function. The frequency of active talker retrieval is determined by the application, although internally the active talkers are updated every 100 ms.

The internal implementation of the active talker feature consists of three parts:

1. The DSPs on the DCB/SC boards are programmed to furnish non-silence information for each of the 32 resources every 100 ms. This information is in bit form and is referred to as active talker indicator (ATI) bits. If the bit associated with a resource is on, it indicates non-silence energy in that resource during the time interval. The ATI bit pattern for a specific instant is retrieved using the `dcb_getatibits()` function.

2. The resource assignment table contains resource assignments of a DSP to conferees in different conferences.

3. A combination of parts one and two is used to provide the output from the `dcb_gettalkers()` function.

1.3.2. Volume Control

A conferee in a conference may wish to change the volume level of the received signal. This is accomplished using the volume control feature.

The MSG_VOLDIG parameter in `dcb_setbrdparm()` allows the application to define the digits that cause the volume level to be adjusted up, down or back to the default value. When a conferee other than a monitor or receive-only party presses a digit programmed to change volume, the received signal is adjusted. The volume control digits do not cause events to be sent to the application, even if digit detection is turned on using the `dcb_setdigitmsk()` function. Volume control digits are used only for controlling volume.
1.3.3. Resource Allocation

As stated earlier, each DSP has 32 resources. The available resource count is retrieved using the `dcb_dsprescount()` function. Calling any of the following functions will cause the available resource count to change:

<table>
<thead>
<tr>
<th>Function</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dcb_estconf()</code></td>
<td>Uses the total number of conferees established in the new conference.</td>
</tr>
<tr>
<td><code>dcb_addtoconf()</code></td>
<td>Uses one resource every time a conferee is successfully added to a conference.</td>
</tr>
<tr>
<td><code>dcb_remfromconf()</code></td>
<td>Frees one resource.</td>
</tr>
<tr>
<td><code>dcb_delconf()</code></td>
<td>Frees all resources in use by the conference, including the monitor.</td>
</tr>
<tr>
<td><code>dcb_monconf()</code></td>
<td>Uses one resource.</td>
</tr>
<tr>
<td><code>dcb_unmonconf()</code></td>
<td>Frees one resource.</td>
</tr>
</tbody>
</table>

**NOTE:** The channel selector value of the conferee does not affect the resource usage.

1.4. Compatibility

The Dialogic Audio Conferencing products (DCB/SC boards) interface with other Dialogic digital front-end products, such as the D/240SC-T1 and D/300SC-E1 boards. The DCB/SC boards do not interface with analog front-end boards, such as the D/160SC-LS, LSI/81C, LSI/161SC, MSI/SC boards.

1.5. Functional Description

The DCB/xxxSC series of Dialogic audio conferencing products can provide from 32 to 96 conferencing resources in increments of 32. The number of resources on any board is determined by the number of DSPs resident on the board. The baseboard with one DSP, DCB/320SC, is used for a 32 conferencing resource solution. The baseboard with two DSPs, DCB/640SC, is used for a 64 conferencing resource solution. The baseboard and daughterboard with an additional DSP, DCB/960SC, is used for a 96 conferencing resource solution.
1. Introduction

Each DCB/SC product is built of one or more conference subassemblies. A subassembly consists of an SC2000 chip and a Motorola 56002 DSP (with attendant high speed RAM). Both of these components are under the control of the single Intel 80C286 control processor, and serviced by a single High-level Data Link Controller (HDLC) HDLC controller and dual-ported shared RAM.

Each conference subassembly can fully process up to 32 digitally derived conference parties. The subassembly is capable of maintaining up to 16 simultaneous conferences. The maximum conference size is 32 parties, hence all 32 parties of a given subassembly could reside in the same conference. Conferences can be created, deleted, or modified up to the conferee limits. Each subassembly implements the DCB/SC conferencing features described in Section 1.2. Dialogic Audio Conferencing Features.

The on-board control processors control access to the SCbus. This message bus is a separate SCbus channel carrying messages and control information among devices, such as out-of-band signaling and collision detection and resolution information. Out-of-band signaling enables faster response time to the messages and control information carried on the dedicated message channel. Bus contention and resolution capability uses a set of fixed and rotating guidelines to detect when two devices are trying to access the same SCbus slot and resolves this situation so each resource has equal access.

The on-board control processor(s) control all operations of the DCB/SC board via a local bus and interprets and executes commands from the host PC. The processor(s) handle real-time events, manages data flow to the host PC to provide faster system response time, reduces PC host processing demands, and frees the DSPs to perform signal processing. Communications between a processor and the host PC is via the dual-port shared RAM that acts as an input/output buffer. This RAM interfaces to the host PC via the ISA bus. All operations are interrupt driven to meet the demands of real-time systems. When the system is initialized, DCB/SC firmware to control all board operations is downloaded from the host PC to the on-board code/data RAM and DSP RAM.

The board locator technology (BLT) circuit operates in conjunction with a rotary switch eliminating the need to set any jumpers or DIP switches.

Products Covered by this Guide

The Dialogic Audio Conferencing product line consists of three models listed in the table below.

<table>
<thead>
<tr>
<th>Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DCB/320SC</td>
<td>Baseboard-only product with 1 DSP for 32 audio conferencing resources.</td>
</tr>
<tr>
<td>DCB/640SC</td>
<td>Baseboard-only product with 2 DSPs for 64 audio conferencing resources.</td>
</tr>
<tr>
<td>DCB/960SC</td>
<td>Baseboard product with 2 DSPs and 1 daughterboard with 1 DSP for 96 audio conferencing resources.</td>
</tr>
</tbody>
</table>

Product Terminology

The following product naming conventions are used throughout this guide:

\textbf{D/41ESC} refers to the Dialogic 4-channel voice board with on-board analog loop start interface.

\textbf{D/160SC-LS} refers to the Dialogic 16-channel voice board with on-board analog loop start interface.

\textbf{D/240SC} refers to the Dialogic 24-channel voice board for use with a network interface board.

\textbf{D/240SC-T1} refers to the Dialogic 24-channel voice board with on-board T-1 digital interface.

\textbf{D/300SC-E1} refers to the Dialogic 30-channel voice board with on-board E-1 digital interface.

\textbf{D/300SC} refers to the Dialogic voice board for use with a network interface board.
DCB/SC refers to the Dialogic single slot, DSP-based conferencing solution.

DIALOG/HD or SpanCard refers to voice and telephone network interface resource boards that communicate via the SCbus. These boards include D/160SC-LS, D/240SC, D/240SC-T1, D/241SC, D/300SC-E1, D/300SC, and D/301SC.

MSI/SC refers to the Dialogic modular station interface board for the SCbus.

MSI/SC-R refers to the Dialogic station interface product with ringing capability.

SCbus is the TDM (Time Division Multiplexed) bus voice, telephone network interface, and other technology resource boards together.

SpanCard - same as DIALOG/HD.

VFX/40ESC is a Dialogic SCbus voice and fax resource board with on-board analog loop-start interfaces. The VFX/40ESC board consists of a D/41ESC baseboard and a FAX/40E daughterboard that provides 4-channels of enhanced voice and fax services in a single slot. Throughout this document, all references to the D/41ESC board apply to the D/41ESC baseboard component of the VFX/40ESC board.

For additional information on these products, refer to the manuals listed in Appendix B.

How to Use this Guide

This guide is written for users who have purchased a Dialogic DCB/SC board and the Dialogic Audio Conferencing Package software for installation on a PC operating in a Windows NT environment.

The following steps explain the order in which the board and Dialogic software for Windows NT should be installed, checked, and programmed:

1. Prepare the board for installation using the appropriate hardware quick installation card (see Appendix B).
2. Install the board in your PC following the procedure in the hardware quick installation card (see Appendix B).
1. Introduction

3. Install the necessary software following the procedure described in the Dialogic Audio Conferencing Package Release Notes for Windows NT.

4. Refer to this Dialogic Audio Conferencing Software Reference for Windows NT to develop application programs.

To use software for other Dialogic devices, refer to the appropriate software reference for specific instructions (see Appendix B).
2. DCB/SC Library Function Overview

The Dialogic DCB/SC Windows NT library provides support for the Dialogic Dialogic Audio Conferencing product line. This chapter provides an overview of the library functions. A detailed reference for these functions is located in Chapter 3.

2.1. Library Function Categories

The DCB/SC library functions provide the necessary building blocks to create digital conferencing applications. These functions can be divided into the following categories:

- **Auxiliary**
  - adds flexibility while using active talker feature

- **Conference Management**
  - controls conferencing

- **Configuration**
  - sets or retrieves device parameters

- **Device Management**
  - opens and closes devices

Each category and its functions are briefly described in the following sections.

2.1.1. Auxiliary Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dcb_evtstatus()</td>
<td>gets or sets the status of a process-wide event</td>
</tr>
<tr>
<td>dcb_getatibits()</td>
<td>reads active talker bits</td>
</tr>
<tr>
<td>dcb_gettalkers()</td>
<td>gets active talkers in a conference</td>
</tr>
</tbody>
</table>

The `dcb_getatibits()` function provides flexibility while using the active talker feature. `dcb_evtstatus()` is used to retrieve or set events related to the process and not a specific device. `dcb_gettalkers()` retrieves active talker information.
2.1.2. Conference Management Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dcb_addtoconf()</td>
<td>adds one conferee to an existing conference</td>
</tr>
<tr>
<td>dcb_delconf()</td>
<td>deletes a conference</td>
</tr>
<tr>
<td>dcb_estconf()</td>
<td>establishes a conference</td>
</tr>
<tr>
<td>dcb_getcde()</td>
<td>retrieves the attributes of a conferee</td>
</tr>
<tr>
<td>dcb_getcnflist()</td>
<td>gets list of conferees in a conference</td>
</tr>
<tr>
<td>dcb_monconf()</td>
<td>adds a monitor to a conference</td>
</tr>
<tr>
<td>dcb_remfromconf()</td>
<td>removes a conferee from a conference</td>
</tr>
<tr>
<td>dcb_setcde()</td>
<td>sets the attributes of a conferee</td>
</tr>
<tr>
<td>dcb_unmonconf()</td>
<td>removes the monitor from a conference</td>
</tr>
</tbody>
</table>

These functions are used to manage all conference activities.

2.1.3. Configuration Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dcb_dsprescount()</td>
<td>retrieves the free resource count</td>
</tr>
<tr>
<td>dcb_getbrdparm()</td>
<td>gets DCB/SC board device parameters</td>
</tr>
<tr>
<td>dcb_getdigitmsk()</td>
<td>reads digit event message mask</td>
</tr>
<tr>
<td>dcb_setbrdparm()</td>
<td>changes DCB/SC board device parameters</td>
</tr>
<tr>
<td>dcb_setdigitmsk()</td>
<td>sets digit event message mask</td>
</tr>
</tbody>
</table>

These functions set the DCB/SC board or DSP device parameters, check the status of the DCB/SC board or DSP device parameter settings, and retrieve or set specific information about the DCB/SC DSPs or conferences.

2.1.4. Device Management Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dcb_open()</td>
<td>opens a DCB/SC device</td>
</tr>
<tr>
<td>dcb_close()</td>
<td>closes a DCB/SC device</td>
</tr>
</tbody>
</table>
2. DCB/SC Library Function Overview

These functions are used to open and close DCB/SC devices. Before using any other DCB/SC library function on a specific device, the device must first be opened. Each time a device is opened using `dcb_open()`, the function returns a new unique device handle.

2.2. Error Handling

All the DCB/SC library functions return a value that indicates the success or failure of the function call. DCB/SC library functions return one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>function success</td>
</tr>
<tr>
<td>-1</td>
<td>function error</td>
</tr>
</tbody>
</table>

If a function fails, the error can be retrieved using the Standard Runtime Library (SRL) function `ATDV_LASTERR()`.

NOTES: 1. The function `dcb_open()` is an exception to the above error-handling rules. A `dcb_open()` function call returns a device handle if the function call is successful. A device handle is a non-zero value. If `dcb_open()` fails, the return code is -1 and the specific error is found in `errno` defined in `errno.h`.

2. If the error returned by `ATDV_LASTERR()` is `EDT_SYSTEM`, a Windows NT system error has occurred, and you need to check the global variable `errno` defined in `errno.h`.

The causes and values of error codes that may be returned to the application by the DCB/SC board are a subset of errors used for the Dialogic Digital Network Interface products or the Dialogic Modular Station Interface (MSI/SC) products. The following tables list possible error codes.
Table 1. Error Types Defined in dtlib.h

<table>
<thead>
<tr>
<th>Error Returned</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EDT_SH_LIBBSY</td>
<td>Switching Handler Library is busy.</td>
</tr>
<tr>
<td>EDT_SH_BADINDX</td>
<td>Invalid Switching Handler index number.</td>
</tr>
<tr>
<td>EDT_SH_LIBNOTINIT</td>
<td>Switching Handler Library has not been initialized.</td>
</tr>
<tr>
<td>EDT_SH_NOCLK</td>
<td>Switching Handler Clock fallback failed.</td>
</tr>
<tr>
<td>EDT_SH_MISSING</td>
<td>Switching Handler is not present.</td>
</tr>
<tr>
<td>EDT_SH_BADMODE</td>
<td>Invalid bus mode.</td>
</tr>
<tr>
<td>EDT_SH_BADLCLTS</td>
<td>Invalid local time slot number.</td>
</tr>
<tr>
<td>EDT_SH_BADTYPE</td>
<td>Invalid local time slot type.</td>
</tr>
<tr>
<td>EDT_ADDR</td>
<td>Incorrect address.</td>
</tr>
<tr>
<td>EDT_BADBRDERR</td>

### 2.3. Include Files

Function prototypes and equates are defined in `dtilib.h`, `msilib.h`, and `dcblib.h`. Applications that use the DCB/SC Windows NT library functions for DCB/SC support must include the following statements:

```c
#include <windows.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
```

To perform error handling in your routines, your source code must also include the following line:

```c
#include <errno.h>
```

Code that uses voice resources must include the following statements in the order shown:

```c
#include <windows.h>
#include <errno.h>
#include "srllib.h"
#include "dxxxlib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
```
3. Function Reference

This chapter contains an alphabetical listing of the Dialogic DCB/SC library functions used to interface with the DCB/SC board. For information about Standard Attribute functions, refer to Appendix A.

3.1. Documentation Conventions

Each function provides the following information:

**Function Header**  Located at the beginning of each function. The header lists the function name, function syntax, input parameters, outputs or returns, include files, function category, and mode (asynchronous and/or synchronous). The function syntax and inputs are shown using standard C language syntax.

**Description**  Provides a detailed description of the function operation, including parameter descriptions.

**Cautions**  Provides warnings and reminders.

**Example**  Provides one or more C language coding examples showing how the function can be used.

**Errors**  Provides error code information for each function.

**See Also**  Provides a list of related functions.
**dcb_addtoconf()**  
adds one conferee to an existing conference

<table>
<thead>
<tr>
<th>Name:</th>
<th>int dcb_addtoconf(devh,confid,cdt)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inputs:</td>
<td></td>
</tr>
</tbody>
</table>
- int devh  
- int confid  
- MS_CDT *cdt |
| Returns: | 0 on success  
-1 on failure |
| Includes: | srllib.h  
dililb.h  
mslib.h  
dcblib.h |
| Category: | Conference Management |
| Mode: | synchronous |

**Description**

The `dcb_addtoconf()` function adds one conferee to an existing conference. The conference identifier specifies the conference to which the conferee will be added. The `cdt` parameter describes the added conferee.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>devh:</td>
<td>The DCB/SC DSP device handle.</td>
</tr>
<tr>
<td>confid:</td>
<td>The conference identifier number.</td>
</tr>
<tr>
<td>cdt:</td>
<td>Pointer to the conference descriptor element.</td>
</tr>
</tbody>
</table>

**NOTES:**

1. Only one conferee can be added at a time using this function.

2. Invoking this function uses one conferencing resource each time a conferee is successfully added to a conference.

A conference descriptor element has the form of the MS_CDT structure. The format is as follows:

```c
typedef struct {
    int chan_num;    /* time slot number */
    int chan_sel;    /* meaning of time slot number */
    int chan_attr;   /* attribute description */
} MS_CDT;
```
adds one conferee to an existing conference  \hspace{1cm} \texttt{dcb_addtoconf( )}

The \texttt{chan_num} denotes the SCbus transmit time slot number of the device to be included in the conference. The \texttt{chan_sel} defines the meaning of \texttt{chan_num}. At present, \texttt{chan_sel} must be set to the following value:

- \texttt{MSPN_TS} \hspace{1cm} SCbus time slot

The \texttt{chan_attr} is a bitmask describing the conferee’s properties within the conference. Valid choices are:

- \texttt{MSPA_NULL} \hspace{1cm} No special attributes for conferee.
- \texttt{MSPA_RO} \hspace{1cm} Conferee participates in conference in receive-only mode.
- \texttt{MSPA_TARIFF} \hspace{1cm} Conferee receives periodic tone for duration of call.
- \texttt{MSPA_COACH} \hspace{1cm} Conferee is a coach. Coach heard by pupil only.
- \texttt{MSPA_PUPIL} \hspace{1cm} Conferee is a pupil. Pupil hears everyone including the coach.

\begin{table}[h!]
\centering
\begin{tabular}{|c|c|c|c|}
\hline
Pupil & Coach & Periodic Tone & Receive-only mode \\
\hline
 & & X & \\
\hline
 & X & & X \\
\hline
 & & X & X \\
\hline
X & & & X \\
\hline
X & & X & \\
\hline
\end{tabular}
\caption{Valid Attribute Combinations}
\end{table}

\textbf{NOTES:}
1. Only one coach and one pupil are allowed in a conference at any time.
2. The default \texttt{MSPA_NULL} must be used if channel attributes are not set.
3. Invalid attribute combinations may lead to unexpected results.
**dcb_addtoconf( )**  
*adds one conferee to an existing conference*

This function returns the SCbus listen time slot number for the MSPN_TS party. The number is placed in the chan_lts field of the MS_CDT structure for the MSPN_TS party. The chan_lts field is defined as follows:

```
#define   chan_lts     chan_attr
```

The chan_lts value must be used by the application to listen to the conferenced signal.

**Cautions**

This function fails when:

- The device handle specified is invalid.
- Too many parties are specified for a single conference.
- The conference ID is invalid.
- DSP resources are not available.

**Example**

```c
#include <windows.h>
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#include "errno.h"
#define NUM_PARTIES     2

main()
{
    int  dspdevh;                       /* DCB/SC DSP device descriptor */
    int  tsdevh1, tsdevh2, tsdevh3;     /* Time slot device descriptor */
    MS_CDT  cdt[NUM_PARTIES];           /* Conference descriptor table */
    int  confid;                        /* Conference ID */
    SC_TSINFO tsinfo;                   /* Time slot information structure */
    long  scsct;                         /* SCbus time slot */

    /* Open DCB/SC board 1, DSP 1 device */
    if ((dspdevh = dcb_open("dcbB1D1",0)) == -1) {
        printf( "Cannot open dcbB1D1: errno = %d\n", errno);
        exit(1);
    }

    /* Open DTI board 1, time slot 1 */
    if ((tsdevh1 = dt_open("dtiB1T1",0)) == -1) {
        printf( "Cannot open dtiB1T1: errno = %d", errno);

    /* Assume DCB/SC is connected to a DTI via SCbus. */
    
    /* Open DTI board 1, time slot 1 */
    if ((tsdevh1 = dt_open("dtiB1T1",0)) == -1) {
        printf( "Cannot open dtiB1T1: errno = %d", errno);
```
adds one conferee to an existing conference

    exit(1);
}

/* Delete the conference */
if (dcb_delconf(dspdevh, confid) == -1) {
    printf("Cannot delete conference %d. Error Message = %s", confid, ATDV_ERRMSGP(dspdevh));
    exit(1);
}

if (dt_close(tsdevh1) == -1) {
    printf("Error closing tsdevh1\n");
    exit(1);
}
```

adds one conferee to an existing conference  

dcb_addtoconf()  

```c
if (dt_close(tsdevh2) == -1) {
    printf("Error closing tsdevh2\n");
    exit(1);
}

if (dt_close(tsdevh3) == -1) {
    printf("Error closing tsdevh3\n");
    exit(1);
}

if (dcb_close(dspdevh) == -1){
    printf("Cannot close dcbB1D1. errno = %d\n", errno);
    exit(1);
}
}
```

**Errors**

If the function does not complete successfully, it will return -1 to indicate an error. Use the Standard Attribute functions `ATDV_LASTERR()` to obtain the applicable error value, or `ATDV_ERRMSGP()` to obtain a more descriptive error message.

Refer to the error type tables found in Chapter 2. DCB/SC Library Function Overview of this guide. Error defines can be found in `dtlib.h`, `msilib.h` or `dcblib.h`.

</tbody>
</table>

<table>
<thead>
<tr>
<th>Category</th>
<th>Device Management</th>
</tr>
</thead>
</table>

| Mode          | synchronous       |

**Description**

The `dcb_close()` function closes the DCB/SC device previously opened by `dcb_open()`. The devices are either DCB/SC boards or DSPs on the board. The `dcb_close()` function releases the handle.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| devh:     | The valid DCB/SC device handle returned by a call to `dcb_open()`.

**Cautions**

1. This function fails if the device handle is invalid.
2. The `dcb_close()` function affects only the link between the calling process or thread and the device. Other processes or threads are unaffected by `dcb_close()`.
3. If event notification is active for the device to be closed, call the SRL `sr_dishdlr()` function prior to calling `dcb_close()`.
4. A call to `dcb_close()` does not affect the configuration of the DCB/SC.
**Example**

```c
#include <windows.h>
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#include "erreno.h"

main()
{
    int dspdevh; /* DSP device descriptor variable */

    /* Open DCB/SC board 1, DSP 2 device */
    if ((dspdevh = dcb_open("dcbB1D2",0)) == -1) {
        printf("Cannot open DSP dcbB1D2: errno = %d", errno);
        exit(1);
    }

    /* Continue Processing */

    /* Done processing - close device */
    if (dcb_close(dspdevh) == -1) {
        printf("Cannot close DSP dcbB1D2: errno = %d", errno);
        exit(1);
    }
}
```

**Errors**

The `dcb_close()` function does not return errors in the standard return code format. If an error occurred during the `dcb_close()` call, a -1 will be returned, and the specific error number will be returned in the `errno` global variable.

**See Also**
- `dcb_open()`
**dcb_delconf( )** deletes a *previously established conference*

**Name:**
int dcb_delconf(devh, confid)

**Inputs:**
- devh
  - DCB/SC DSP device handle
- confid
  - conference identifier

**Returns:**
- 0 on success
- -1 on failure

**Includes:**
srllib.h
dilib.h
msilib.h
dcblib.h

**Category:**
Conference Management

**Mode:**
synchronous

### Description

The **dcb_delconf( )** function deletes a previously established conference. The conference ID specifies the conference to be deleted.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>devh:</td>
<td>The DCB/SC DSP device handle.</td>
</tr>
<tr>
<td>confid:</td>
<td>The DCB/SC conference identifier.</td>
</tr>
</tbody>
</table>

**NOTES:**

1. Calling this function frees all resources in use by the conference.
2. Dialogic recommends that the appropriate **xx_unlisten( )** function be called for each conferee before **dcb_delconf( )** is called.

### Cautions

This function fails when:

- The specified device handle is invalid.
- The conference ID is invalid.

### Example

```c
#include <windows.h>
#include <stdio.h>
```
#include "srllib.h"
#include "dtlib.h"
#include "msilib.h"
#include "dcblib.h"
#include "errno.h"

#define NUM_PARTIES 2

main()
{

- msilib.h
- dcblib.h

**Category:**
- Configuration

**Mode:**
- synchronous

## Description

The **dcb_dsprescount( )** function returns the available conferencing resource count for a specified DSP. Each DSP has 32 resources managed by the application.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>devh:</td>
<td>The DCB/SC DSP device handle.</td>
</tr>
<tr>
<td>valuep:</td>
<td>Integer pointer to where the free DSP resource count is returned.</td>
</tr>
</tbody>
</table>

Calling any of the following functions will cause the available resource count to change:
returns the available conferencing resource count

### Cautions

This function fails when the device handle specified is invalid.

### Example

```c
#include <windows.h>
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#include "errno.h"

main()
{
  int dspdevh; /* DCB/SC DSP device descriptor */
  int count;   /* DSP resource count */

  /* Open DCB/SC board 1, DSP 2 */
  if ((dspdevh = dcb_open("dcbB1D2",0)) == -1) {
    printf("Cannot open dcbB1D2: errno = %d\n", errno);
    exit(1);
  }

  /* Get unused conference-resource count for dspdevh */
  if (dcb_dsprescount(dspdevh, &count) == -1) {
    printf("Error Message : %s", ATDV_ERRMSGP(dspdevh));
    exit(1);
  } else
    printf("Free DSP Resource count = %d\n", count);

  if (dcb_close(dspdevh) == -1) {
    printf("Cannot close dcbB1D2 : %s\n", ATDV_ERRMSGP (dspdevh)),
```

```c
exit(1);
}
}
```

## Errors

If the function does not complete successfully, it will return -1 to indicate an error. Use the Standard Attribute functions `ATDV_LASTERR()` to obtain the applicable error value, or `ATDV_ERRMSGP()` to obtain a more descriptive error message.

Refer to the error type tables found in Chapter 2. `DCB/SC Library Function Overview` of this guide. Error defines can be found in `ditilb.h`, `msilib.h` or `dcblib.h`.

**Category:** Conference Management  
**Mode:** synchronous

### Description

The `dcb_estconf()` function establishes a conference of up to four parties. A conference is associated with a DSP and all DSP resources used by the conference are on that DSP. When `dcb_estconf()` returns successfully, `confid` will contain the conference identification number for use in all further modifications to that conference.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>devh:</td>
<td>The DCB/SC DSP device handle.</td>
</tr>
<tr>
<td>cdt:</td>
<td>Pointer to the conference descriptor table.</td>
</tr>
<tr>
<td>numpty:</td>
<td>Number of parties in the conference.</td>
</tr>
<tr>
<td>confattr:</td>
<td>The conference attributes.</td>
</tr>
<tr>
<td>confid:</td>
<td>Pointer to the conference ID number.</td>
</tr>
</tbody>
</table>
The conference descriptor table is an array of the MS_CDT structure. The MS_CDT structure has the following format:

```
typedef struct {
    int chan_num;  /* SCbus time slot number */
    char chan_sel; /* meaning of time slot number */
    int chan_attr; /* attribute description */
} MS_CDT;
```

The chan_num field denotes the SCbus transmit time slot number of the device to be included in the conference. The chan_sel defines the meaning of the chan_num. At present, chan_sel must be set to the following value:

- **MSPN_TS**  SCbus time slot number

chan_attr is a bitmask describing the conferee’s properties within the conference. Valid choices are:

- **MSPA_NULL**  No special attributes for conferee. The conferee hears everyone except the coach.
- **MSPA_RO**  Conferree participates in conference in receive-only mode.
- **MSPA_TARIFF**  Conferree receives periodic tone for duration of call.
- **MSPA_COACH**  Conferree is a coach. Coach is heard by pupil only.
- **MSPA_PUPIL**  Conferree is a pupil. Pupil hears everyone including coach.

### Table 4. Valid Attribute Combinations

<td></td>
<td></td>
</tr>
</tbody>
</table>
establishes a conference \hspace{1cm} \textit{dcb\_estconf()} \hspace{1cm}

\underline{NOTES:}  
1. Only one coach and one pupil are allowed in a conference at any time. Specifying more than one of either will cause unexpected results.
2. The default MSPA\_NULL must be used if channel attributes are not specified.
3. Invalid attribute combinations may lead to unexpected results.

The conference attribute parameter, \texttt{conf\_attr}, is a bitmask describing the properties of the conference. The properties are in effect for all parties in the conference.

- **MSCA\_ND** All parties in conference are notified by a tone if another conferee is added or removed from a conference.
- **MSCA\_NN** If MSCA\_ND is set, do not notify conferees if a conferee joins the conference in receive-only mode or as a monitor.
- **MSCA\_NULL** No special attributes.

For MSCA\_NN to have an effect, it should be ORed together with MSCA\_ND.

The default MSCA\_NULL must be used if the conference attribute is not specified.

For each member of a conference, the number of the SCbus time slot to listen to is returned in the \texttt{chan\_lts} field of MS\_CDT. The \texttt{chan\_attr} field in the CDT structure is redefined as follows:

```c
#define     chan\_lts                  chan\_attr
```

\underline{NOTES:}  
1. Calling this function causes \texttt{numpty} resources to be used when the conference is successfully established.
2. This function may be used to establish a conference of up to 4 parties. You must use \texttt{dcb\_addtoconf()} or \texttt{dcb\_monconf()} to increase the size of the conference.
dcb_estconf() establishes a conference

■ Cautions

This function fails when:

• An invalid device handle is specified.
• DSP resources are not available.

■ Example

```c
#include <windows.h>
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#include "errno.h"
#define NUM_PARTIES 2

main()
{
    int dspdevh; /* DCB/SC DSP Device handle variable */
    int tsdevh1, tsdevh2; /* Time slot device handles */
    MS_CDT cdt[NUM_PARTIES]; /* Conference descriptor table */
    SC_TSINFO tsinfo; /* Time slot information structure */
    int confid; /* Conference ID */
    long scts; /* SCbus time slot */

    /* Open DCB/SC board 1, DSP 2 device */
    if ((dspdevh = dcb_open("dcbB1D2", 0) == -1) { 
        printf("Cannot open dcbB1D2. errno = %d", errno);
        exit(1); 
    }

    /* Open network board 1, time slot 1 */
    if ((tsdevh1 = dt_open("dtiB1T1", 0)) == -1) {
        printf("Cannot open dtiB1T1: errno=%d", errno);
        exit(1);
    }

    tsinfo.sc_numts = 1;
    tsinfo.sc_tsarrayp = &scts;

    if (!dt_getxmitslot(tsdevh1, &tsinfo) == -1){
        printf("Error Message = %s", ATDV_ERRMSGP(tsdevh1));
        exit(1);
    }

    /* Set up CDT structure */
    cdt[0].chan_num = (int)scts; /* scts is the time slot... */
    cdt[0].chan_sel = MSPN_TS; /* ...returned from getxmitslot() */
    cdt[0].chan_attr = MSPA_TARIFF;

    /* Open board 1, time slot 2 */
    if ((tsdevh2 = dt_open("dtiB1T2", 0)) == -1) {
        printf("Cannot open dtiB1T2: errno=%d", errno);
        exit(1);
    }
```
establishes a conference  

dcb_estconf()  

```c
if (dt_getxmitslot(tsdevh2, &tsinfo) == -1){
    printf("Error Message = ts",ATDV_ERRMSGP(tsdevh2));
    exit(1);
}

/* SCbus time slot to be conferenced */
ct[1].chan_num = (int)scts; /* scts is the time slot... */
ct[1].chan_sel = MSPN_TS;   /* ...returned from getxmitslot() */
ct[1].chan_attr = MSPA_PUPIL; /* Conferee may be coached later */

/* Establish conference */
if (dcb_estconf(dspdevh, ct, NUM_PARTIES, MSCA_ND, &confid) == -1){
    printf("Error Message = ts",ATDV_ERRMSGP(dspdevh));
    exit(1);
}

/* Do a listen() for the tsdevh1 to its conference signal */
tsinfo.sc_numts = 1;
tinfo.sc_tsarrayp = &cdt[0].chan_lts;
if (dt_listen(tsdevh1,&tsinfo) == -1){
    printf("Error Message = ts",ATDV_ERRMSGP(tsdevh1));
    exit(1);
}

/* Do a listen() for the tsdevh2 to its conference signal */
tsinfo.sc_numts = 1;
tinfo.sc_tsarrayp = &cdt[1].chan_lts;
if (dt_listen(tsdevh2,&tsinfo) == -1){
    printf("Error Message = ts",ATDV_ERRMSGP(tsdevh2));
    exit(1);
}

/* Continue processing */

/* Unlisten the time slots */
if (dt_unlisten(tsdevh1) == -1){
    printf("Error Message = ts",ATDV_ERRMSGP(tsdevh1));
    exit(1);
}
if (dt_unlisten(tsdevh2) == -1){
    printf("Error Message = ts",ATDV_ERRMSGP(tsdevh2));
    exit(1);
}
if (dt_close(tsdevh1) == -1){
    printf("Error closing tsdevh1\n");
    exit(1);
}
if (dt_close(tsdevh2) == -1){
    printf("Error closing tsdevh2\n");
    exit(1);
}

/* Delete the conference */
if(dcb_delconf(dspdevh, confid) == -1) {
```
dcb_estconf( ) establishes a conference

printf("Cannot delete conference %d. Error Message = %s", confid, ATDV_ERRMSGP(dspdevh));
exit(1);
}

/* Done Processing - Close device */
if(dcb_close(dspdevh) == -1) {
    printf("Cannot close DSP dcbB1D2. errno = %d", errno);
    exit(1);
}

Errors

If the function does not complete successfully, it will return -1 to indicate an error. Use the Standard Attribute functions ATDV_LASTERR( ) to obtain the applicable error value, or ATDV_ERRMSGP( ) to obtain a more descriptive error message.

Refer to the error type tables found in Chapter 2. DCB/SC Library Function Overview of this guide. Error defines can be found in dtilib.h, msilib.h or dcblib.h.

### dcb_evtstatus()

**Name:** int dcb_evtstatus(event, action, status)

**Inputs:**
- unsigned char event
- unsigned char action
- unsigned char *status

**Returns:**
- 0 on success
- -1 on failure

**Includes:**
- srllib.h
- dtlib.h
- msilib.h
- dcblib.h

**Category:** Auxiliary

**Mode:** synchronous

---

#### Description

The `dcb_evtstatus()` function gets or sets the status of a process-wide event. Certain features of the Dialogic Audio Conferencing software are board-level features in that they are enabled or disabled on a per board basis. Process-wide events are enabled or disabled once for all devices used by that process.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event:</td>
<td>The specified process-wide event.</td>
</tr>
<tr>
<td>action:</td>
<td>Specifies whether the event status is to be set or retrieved.</td>
</tr>
<tr>
<td>status:</td>
<td>If the event status is being set, ON or OFF is passed to the function in this parameter. If the event status is being retrieved, this parameter will contain ON or OFF when the function returns.</td>
</tr>
</tbody>
</table>

**event** must be set to MSG_RESTBL. MSG_RESTBL controls the resource table update event generation. The resource assignment table is the mapping of resources to conferees. Anytime there is a change in this mapping and event generation is enabled, a DCBEV_CTU event is generated. Associated with this event is the resource table. An application may be in the resource table implementing active talkers. When this event notification is enabled, and the application makes a change to the assignment of conferencing resources on a
**dcb_evtstatus()** gets or sets the status of a process-wide event

DCB/SC board, a DCBEV_CTU event will be generated. The updated resource table will be returned as the event data. Refer to the code example for details.

**action** may be set to SET_EVENT or GET_EVENT.

The **status** parameter may contain ON or OFF.

To enable an event handler for a specified event, follow these steps:

1. Call **sr_enbhdlr()**. This function specifies the event and the application defined event handler that is called from a signal handler.
2. Call **dcb_evtstatus()**. This function sets the digit message mask.

**NOTE:** The request for an event to be posted to an event handler must be specified using both the **sr_enbhdlr()** and **dcb_evtstatus()** functions.

### Cautions

**dcb_evtstatus()** is a process-wide function and does not have a Dialogic device-handle as one of its parameters. Any event set ON or OFF is set for all devices used by the process, not for any particular device.

### Example

```c
#include <windows.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#include "errno.h"

#define   MAX_PTY     32
#define   TABLE_SIZE 192

DCB_CT res_table[MAX_PTY];    /* DCB_CT structure array */

void handler()
{
    int   size = sr_getevtlen();
    char *datap = (char *)sr_getevtdatap();
    int   event_type = (int)sr_getevttype();

    printf("Event occurred on %s : Data size = %d : Data is at 0x%x\n", 
        ATDV_NAMEP(sr_getevtdev()), size, datap);

    if (event_type == DCBEV_CTU) {
        memcpy(res_table, datap, TABLE_SIZE);
    }
}
```

42
gets or sets the status of a process-wide event 

dcb_evtstatus()
/* Establish a conference and continue processing */
/* Wait in a 1000-count loop to get the active talkers */
while (count--)
    if (dcb_getatibits(dspdevh, &atibits) == -1)
        {
            printf("Error Message : %s", ATDV_ERRMSGP(dspdevh));
            exit(1);
        }
    printf("ATIBITS = %d", atibits);
    for (i=0; i<32; i++)
        if (atibits & (1<<i))
            {
                printf("confid = %d, TimeSlot = %d, Selector = %d", 
                    res_table[i].confid, res_table[i].chan_num, 
                    res_table[i].chan_sel);
            }
/* End of for() loop */
/* End of while() loop */
/* Set Resource Table Update events OFF */
status = OFF;
if (dcb_evtstatus(MSG_RESTBL, SET_EVENT, &status) == -1) 
    {
        printf("Error enabling system-wide event\n");
        exit(1);
    }
/* Disable event handler */
if (sr_dishdlr(EV_ANYDEV, DCBEV_CTU, (void *)handler) == -1) 
    {
        printf("Error in sr_dishdlr()\n");
        exit(1);
    }
/* Done processing - close DSP device */
if (dcb_close(dspdevh) == -1) 
    {
        printf("Cannot close dcbB1D1. errno = %d\n", errno);
        exit(1);
    }
}

Errors

If the function does not complete successfully, it will return -1 to indicate an error. Use the Standard Attribute functions ATDV_LASTERR() to obtain the applicable error value, or ATDV_ERRMSGP() to obtain a more descriptive error message.

Refer to the error type tables found in Chapter 2. DCB/SC Library Function Overview of this guide. Error defines can be found in dtlib.h, msilib.h or dcblib.h.

44
gets or sets the status of a process-wide event  
dcbEvtstatus()  

See Also

• dcbGettalkers()
The `dcb_getatibits()` function returns the active talker indicator bits set at the time this function is called. This function is provided to give more control to the application and must be used with the resource assignment table update event to implement active talker retrieval.

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>devh</code></td>
<td>The valid DSP device handle returned by a call to <code>dcb_open()</code>.</td>
</tr>
<tr>
<td><code>atibits</code></td>
<td>Pointer to location where active talker indicator bits will be stored.</td>
</tr>
</tbody>
</table>

**NOTE:** The snapshot of information provided by `dcb_getatibits` is accurate for a split second. This information may not be accurate by the time the application processes it.

`atibits` is 4 bytes long. Each bit corresponds to one DSP resource and is updated every 100 ms. Bits are turned on or off by the DSP based on the speaker energy (volume) level.

Bit 0 of `atibits` corresponds to resource 0 on the specified DSP. `atibits` should be used with the resource assignment table. The table is copied from the event data returned once the current DCBEV_CTU event is detected by the application.
returns the active talker indicator bits \textbf{dcb\_getatibits( )}

DCBEV\_CTU is enabled using the \textbf{dcb\_evtstatus( )} function. Bit \(n\) should be paired with the \(n\)th DCB\_CT element of the resource table.

**Cautions**

This function fails when the device handle is invalid.

**Example**

```c
#include <windows.h>
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#include "errno.h"

#define MAX_PTY 32
#define TABLE_SIZE 192

DCB\_CT res_table[MAX\_PTY]; /* DCB\_CT structure array */

void handler()
{
    int size = sr\_getevtlen();
    char *datap = (char *)sr\_getevtdatap();
    int event_type = (int)sr\_getevttype();
    printf("Event occurred on %s : Data size = %d : Data is at 0x\%x\n",
           ATDV\_NAMEP(sr\_getevtdev()), size, datap);
    if (event_type == DCBEV\_CTU) {
        memcpy(res_table, datap, TABLE_SIZE);
    } else {
        for (i=0; i<size; i++)
            printf("%d\n", *(datap++));
    }
}

main()
{
    int bddevh, dspdevh; /* DCB/SC board and DSP device descriptors */
    unsigned long atibits; /* Active talker indicator bits */
    int mode = SR\_POLLMODE; /* SRL function-call mode */
    unsigned int status; /* DCB/SC Feature status */
    unsigned int i, count = 1000; /* Loop counters */

    /* Open DCB/SC board device */
    if ((bddevh = dcb\_open("dcbB1", 0)) == -1) {
        printf("Cannot open dcbB1. errno = \%d", errno);
        exit(1);
    }
}
```

        }
    }
        printf("End of for() loop */
} /* End of while() loop */
/* Set Resource Table Update events OFF */
status = OFF;
returns the active talker indicator bits  

\[ \text{dcb_getatibits( )} \]

if (dcb_evtstatus(MSG_RESTBL, SET_EVENT, &status) == -1) {
    printf("Error enabling system-wide event\n");
    exit(1);
}
/* Disable event handler */
if (sr_dishdlr(EV_ANYDEV, DCBEV_CTU, (void *)&handler) == -1) {
    printf("Error in sr_dishdlr()\n");
    exit(1);
}
/* Done processing - close DSP device */
if (dcb_close(dspdevh) == -1) {
    printf("Cannot close dcbB1D1. errno = %d\n", errno);
    exit(1);
}

\section*{Errors}

If the function does not complete successfully, it will return -1 to indicate an error. Use the Standard Attribute functions \texttt{ATDV\_LASTERR( )} to obtain the applicable error value, or \texttt{ATDV\_ERRMSGP( )} to obtain a more descriptive error message.

Refer to the error type tables found in \textit{Chapter 2. DCB/SC Library Function Overview} of this guide. Error defines can be found in \texttt{ditlib.h, msilib.h} or \texttt{dcblib.h}.

\section*{See Also}
- \texttt{dcb_evtstatus( )}
- \texttt{dcb_gettalkers( )}
**dcb_getbrdparm()** retrieves a DCB/SC board parameter value

Name: int dcb_getbrdparm(devh,param,valuep)

Inputs:
- int devh: DCB/SC board device handle
- unsigned char param: device parameter defined name
- void * valuep: pointer to returned parameter value

Returns: 0 on success
-1 on failure

Includes:
- srllib.h
- dtilib.h
- msilib.h
- dcblib.h

Category: Configuration

Mode: synchronous

---

**Description**

The `dcb_getbrdparm()` function retrieves a DCB/SC board parameter value. Each parameter has a symbolic name that is defined in `dcblib.h`. The parameters are explained in the `dcb_setbrdparm()` function description.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>devh:</td>
<td>The valid board device handle returned by a call to <code>dcb_open()</code>.</td>
</tr>
<tr>
<td>param:</td>
<td>The parameter to be examined.</td>
</tr>
<tr>
<td>valuep:</td>
<td>Pointer to the integer or DCB_VOL structure for storage of the parameter value.</td>
</tr>
</tbody>
</table>

The valid values for `param` and `valuep` are shown below:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSG_ACTID</td>
<td>Indicates Active Talker feature status. Possible values are ACTID_ON or ACTID_OFF. ACTID_OFF is the default.</td>
</tr>
<tr>
<td>MSG_VOLDIG</td>
<td>Defines the volume control status and volume up/down/reset digits.</td>
</tr>
</tbody>
</table>
retrieves a DCB/SC board parameter value \texttt{dcb_getbrdparm()} \\

The following structure contains the volume control status and digits:

```c
typedef struct DCB_VOL{
    unsigned char vol_control;
    unsigned char vol_up;
    unsigned char vol_reset;
    unsigned char vol_down;
}DCB_VOL;
```

The digits for volume control are not received by the application. The \texttt{vol\_control} field indicates whether the volume control is turned on or off. The \texttt{vol\_up} field indicates the digit used for increasing the volume level. \texttt{vol\_down} indicates the digit used for decreasing the volume. \texttt{vol\_reset} indicates the digit used to set the volume to its default level. By default, \texttt{vol\_control} is OFF.

\section*{Cautions}

1. The value of the parameter returned by this function is currently an integer or an \texttt{DCB\_VOL} structure. \texttt{valuep} is the address of the value, but should be cast as a void pointer when passed in the value field.

2. This function fails when:
   - The device handle is invalid.
   - The parameter specified is invalid.
   - The DSP device handle is used.

\section*{Example}

```c
#include <windows.h>
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#include "errno.h"

main()
{
    int brddevh; /* Board dev descriptor variables */
    int actid_status; /* Active talker status (ON/OFF) */
    DCB_VOL volume; /* Volume control structure */

    /* Open DCB board 1 */
    if ((brddevh = dcb_open("dcbB1",0)) == -1) {
        printf( "Cannot open dcbB1: errno = \%d\n", errno);
        exit(1);
    }

    /* Retrieve Status (ON/OFF) of the Active Talker Feature */

```
dcb_getbrdparm() retrieves a DCB/SC board parameter value

```c
if (dcb_getbrdparm(brddevh, MSG_ACTID, (void *)&actid_status) == -1) {
    printf("Error getting board param:0x%x\n", ATDV_LASTERR(brddevh));
    exit(1);
}
printf("Active talker identification is \%s\n", (actid_status ? "ON" : "OFF"));

/* Retrieve Information on Volume Control Feature */
if (dcb_getbrdparm(brddevh, MSG_VOLDIG, (void *)&volume) == -1) {
    printf("Error getting volume control parameters : 0x%x\n", ATDV_LASTERR(brddevh));
    exit(1);
}
printf("Volume Control is \%s\n", (volume.vol_control ? "ON" : "OFF"));
printf("The Up Digit is \%d\n", volume.vol_up);
printf("The Reset Digit is \%d\n", volume.vol_reset);
printf("And the Down Digit is \%d\n", volume.vol_down);
/* Continue processing */
if (dcb_close(brddevh)== -1){
    printf("Cannot close dcbB1. errno = \%d\n", errno);
    exit(1);
}
}"
```

**Errors**

If the function does not complete successfully, it will return -1 to indicate an error. Use the Standard Attribute functions ATDV_LASTERR( ) to obtain the applicable error value, or ATDV_ERRMSGP( ) to obtain a more descriptive error message.

Refer to the error type tables found in Chapter 2. DCB/SC Library Function Overview of this guide. Error defines can be found in dtlib.h, msilib.h or dcblib.h.

int dcb_getcde(devh,confid,cdt)  

Inputs:  
int devh  
int confid  
MS_CDT *cdt  

• DCB/SC DSP device handle  
• conference identifier  
• pointer to conference descriptor table element  

Returns:  
0 on success  
-1 on failure  

Includes:  
srllib.h  
dtilib.h  
msilib.h  
dcblib.h  

Category:  Conference Management  
Mode:  synchronous  

Description  
The dcb_getcde() function retrieves the attributes of a conferee in an existing conference.

Parameter  Description  
devh:  The DCB/SC DSP device handle.  
confid:  The conference identifier.  
cdt:  Pointer to the conference descriptor table element.  

This function requires that the conferee’s chan_num and chan_sel be specified. On successful completion, the conference party’s attribute will be returned in the char_attr field of the MS_CDT structure.

The conference descriptor table is an array of the MS_CDT structure. The MS_CDT structure has the following format:

```c
typedef struct {  
    int chan_num;  /* time slot number */  
    int chan_sel;  /* meaning of time slot number */  
    int chan_attr;  /* attribute description */  
} MS_CDT;
```
\textit{dcb\_getcde()} \hspace{1cm} \textit{retrieves the attributes of a conferee}

The \texttt{chan\_num} denotes the SCbus transmit time slot number of the device. The \texttt{chan\_sel} defines the meaning of \texttt{chan\_num}. At present, \texttt{chan\_sel} should be set to the following value:

- \texttt{MSPN\_TS} \hspace{1cm} SCbus time slot number

Channel attribute is a bitmask describing the conferee's properties within the conference. Possible returns are listed in the table below. A combination of any of the attributes shown in the table may be returned.

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
\textbf{Channel Attribute} & \textbf{Description} \\
\hline
\texttt{MSPA\_NULL} & No special attributes for conferee. The conferee hears everyone except the coach. \\
\hline
\texttt{MSPA\_RO} & Conferee participates in the conference in receive-only mode. \\
\hline
\texttt{MSPA\_TARIFF} & Conferee receives periodic tone for duration of call. \\
\hline
\texttt{MSPA\_COACH} & Conferee is a coach. Coach is heard by pupil only. \\
\hline
\texttt{MSPA\_PUPIL} & Conferee is a pupil. Pupil hears everyone including coach. \\
\hline
\end{tabular}
\caption{Possible Returns for Channel Attribute}
\end{table}

\textbf{NOTE:} This function must be invoked multiple times if the attributes of more than one conferee are desired.

\section*{Cautions}

This function fails when:

- The device handle specified is invalid.
- An invalid conference ID is specified.
- The queried conferee is not in the conference.
Example

```c
#include <windows.h>
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#include "errno.h"
#define NUM_PARTIES     2

main()
{
    int dspdevh;            /* DCB/SC DSP device handle */

/* And close all open devices */
if (dt_close(tsdevh1) == -1)
    printf("Error (0x%x) closing tsdevh1\n", errno);
    exit(1);
retrieves the attributes of a conferee

dcb_getcde()
**dcb_getcnflist( )** retrieves a conferee list

**Name:** int dcb_getcnflist(devh, confid, numpty, cdt)

**Inputs:**
- int devh
- int confid
- int *numpty
- MS_CDT *cdt

**Returns:**
- 0 on success
- -1 on failure

**Includes:**
- srllib.h
- dtilib.h
- msilib.h
- dcblib.h

**Category:** Conference

**Mode:** synchronous

**Description**

The function retrieves a conferee list and the total number of parties within a conference. The list contains specific information about each conferee in that conference. The information includes each conferee’s SCbus transmit time slot number, selector, and conferee attribute description.

**NOTE:** The list is not returned in any specified order.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>devh:</td>
<td>The DCB/SC DSP device handle.</td>
</tr>
<tr>
<td>confid:</td>
<td>The conference identifier.</td>
</tr>
<tr>
<td>numpty:</td>
<td>Pointer to the conferee count.</td>
</tr>
<tr>
<td>cdt:</td>
<td>Pointer to the conference descriptor table.</td>
</tr>
</tbody>
</table>

**NOTE:** The application is responsible for allocating an MS_CDT table with sufficient elements. Refer to the sample code.

When a conference is being monitored, one member of the conference list will be the monitor. chan_num for the monitor will equal 0x7FFF and chan_sel will be MSPN_TS.
retrieves a conferee list  
dcb_getcnflist()

The conference descriptor table is an array of the MS_CDT structure. The MS_CDT structure has the following format:

typedef struct {
    int chan_num; /* time slot number */
    int chan_sel; /* meaning of time slot number */
    int chan_attr; /* attribute description */
} MS_CDT;

### Cautions

1. This function fails when an invalid conference ID is specified.

2. It is the responsibility of the application to allocate enough memory for the conference descriptor table. There must be an MS_CDT element allocated for each conferee description returned by this function. For example, if a conference was started with four conferees, and three conferees were added later, the MS_CDT array must be able to hold seven entries.

   **NOTE:** Even though dcb_monconf() does not use the CDT structure, the array must have an additional structure if the conference is being monitored.

### Example

```c
#include <windows.h>
#include <stdio.h>
#include "srllib.h"
#include "dtllib.h"
#include "msilib.h"
#include "dtilib.h"
#include "errno.h"
#define NUM_PARTIES     2

**dcb_getcnflist()** retrieves a conferee list

### Errors

If the function does not complete successfully, it will return -1 to indicate an error. Use the Standard Attribute functions `ATDV_LASTERR()` to obtain the applicable error value, or `ATDV_ERRMSGP()` to obtain a more descriptive error message.

Refer to the error type tables found in *Chapter 2. DCB/SC Library Function Overview* of this guide. Error defines can be found in `dtilib.h`, `msilib.h` or `dcblib.h`.

### See Also

- `dcb_estconf()`
**dcb_getdigitmsk()**

**Name:** int dcb_getdigitmsk(devh, confid, bitmaskp)

**Inputs:**
- int devh • DCB/SC DSP device handle
- int confid • conference identifier
- unsigned int * bitmaskp • pointer to digit bitmask

**Returns:**
- 0 on success
- -1 on failure

**Includes:** srllib.h
dtilib.h
msilib.h
dclib.h

**Category:** Configuration

**Mode:** synchronous

---

**Description**

The **dcb_getdigitmsk()** function returns the digit mask for a specified conference. The values set in the mask correspond to the digits which, when received, will cause a DCBEV_DIGIT event to be generated to the application.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>devh:</td>
<td>The DCB/SC DSP device handle.</td>
</tr>
<tr>
<td>confid:</td>
<td>The conference identifier.</td>
</tr>
<tr>
<td>bitmask:</td>
<td>Pointer to the digit bitmask.</td>
</tr>
</tbody>
</table>

**NOTE:** If MSG_VOLDIG is enabled to give transparent volume control to the conference, the digits for volume increase, decrease, and reset will not cause digit events to be generated. As a result, the application will not know if the volume changes.

---

**Cautions**

This function fails when:

- The device handle specified is invalid.
- An invalid conference ID is specified.

**Example**

```c
#include <windows.h>
#include <stdio.h>

</tbody>
</table>

### Description

The `dcb_gettalkers( )` function retrieves information about the conferees actively talking in the specified conference.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>devh:</td>
<td>The DCB/SC DSP device handle.</td>
</tr>
<tr>
<td>confid:</td>
<td>The conference identifier.</td>
</tr>
<tr>
<td>numpty:</td>
<td>Pointer to number of active talkers.</td>
</tr>
<tr>
<td>talkers:</td>
<td>Pointer to the array of talker descriptions.</td>
</tr>
</tbody>
</table>

**NOTE:** The list is not returned in any specified order.

The returned array of MS_CDT structures contains the active talker descriptions. The array has `numpty` number of elements. Each MS_CDT structure describes one active talker and has the following format:

```c
typedef struct {
    int chan_num;    /* SCbus time slot number */
    int chan_sel;    /* meaning of time slot number */
    int chan_attr;   /* attribute description */
} MS_CDT;
```
**retrieves information about the conferees actively talking dcb_gettalkers()**

chan_num contains the transmit time slot number of the actively talking conferee. chan_sel specifies that the conferee is an SCbus time slot.

**NOTES:**

1. For active talker retrieval, chan_attr is not used.

2. Active talker information is associated with the DSP device handle. The information is invalid upon closing the device.

3. The application is responsible for allocating a table of MS_CDTs large enough to store all the active talkers.

**Cautions**

This function fails when:

- The device handle specified is invalid.
- An invalid conference ID is specified.

**Example**

```c
#include <windows.h>
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#include "errno.h"
#define   NUM_PARTIES   2
#define   MAX_PTY       32

main()
{
  int  dspdevh;    /* DCB/SC DSP device handle */
  int  tsdevh1;    /* DTI time slot device handle */
  int  partycnt;   /* The no. of conferenced parties */

}
/* Done processing - close device */
if (dt_close(tsdevh2) == -1) {
    printf("Error closing %s : errno = %d\n", ATDV_NAMEP(tsdevh2), errno);
    exit(1);
}
/* Done processing - close device */
if (dcb_close(dspdevh) == -1) {
    printf("Cannot close dcbB1D1 : errno = %d\n", errno);
    exit(1);
}

** Errors **

If the function does not complete successfully, it will return -1 to indicate an error. Use the Standard Attribute functions \texttt{ATDV\_LASTERR()} to obtain the applicable error value, or \texttt{ATDV\_ERRMSGP()} to obtain a more descriptive error message.

Refer to the error type tables found in \textit{Chapter 2. DCB/SC Library Function Overview} of this guide. Error defines can be found in \texttt{ditlib.h}, \texttt{msilib.h} or \texttt{dcblib.h}.  

71
`dcb_monconf()` adds a monitor to a conference

**Name:** int dcb_monconf(devh,confid,lts)

**Inputs:**
- int devh • DCB/SC DSP device handle
- int confid • conference identifier
- long *lts • pointer to listen SCbus time slot

**Returns:**
- 0 on success
- -1 on failure

**Includes:**
- srllib.h
- dtilib.h
- msilib.h
- dcblib.h

**Category:** Conference Management

**Mode:** synchronous

### Description

The `dcb_monconf()` function adds a monitor to a conference. A monitor has no input in the conference.

This function places the monitored signal on the SCbus. Several parties can listen to the monitored signal simultaneously.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>devh:</td>
<td>The DCB/SC board device handle.</td>
</tr>
<tr>
<td>confid:</td>
<td>The conference identifier.</td>
</tr>
<tr>
<td>lts:</td>
<td>Indicates the pointer to the returned listen SCbus time slot. The monitored signal is present on this time slot.</td>
</tr>
</tbody>
</table>

A monitor counts as one of the parties in the conference. If all the resources on the DSP are already in use, it is not possible to monitor the conference. When a conference is deleted, the conference monitor is also deleted.

**NOTES:**

1. There may only be one monitor in a conference.

2. Calling this function uses one conferencing resource.

3. It is the application’s responsibility to listen to the time slot on which the monitored signal is transmitted.
adds a monitor to a conference  

dcb_monconf()

**Cautions**

This function fails when:

- The device handle specified is invalid.
- The conference is full.
- There are no more DSP conferencing resources available.
- The conference ID is invalid.

**Example**

```c
#include <windows.h>
#include <stdio.h>
#include "srllib.h"
#include "dtlib.h"
#include "msilib.h"
#include "dclib.h"
#include "errno.h"
#define NUM_PARTIES 2

main()
{
    int dspdevh; /* DCB/SC DSP device handle */
    int tsdevh1, tsdevh2; /* DTI time slot device handles */

    printf("Error closing tsdevh3\n");
    exit(1);

if (dcb_close(dspdevh) == -1)
    printf("Cannot close dcbB1D3. errno = %d\n", errno);
    exit(1);
}
dcb_monconf() adds a monitor to a conference

- **Errors**

  If the function does not complete successfully, it will return -1 to indicate an error. Use the Standard Attribute functions ATDV_LASTERR() to obtain the applicable error value, or ATDV_ERRMSGP() to obtain a more descriptive error message.

  Refer to the error type tables found in Chapter 2. DCB/SC Library Function Overview of this guide. Error defines can be found in dtilib.h, msilib.h or dcblib.h.

- **See Also**

  - dcb_unmonconf()
The `dcb_open()` function opens a device and returns a unique handle to identify the device. The device may be a DCB/SC board or a DSP on the board. All subsequent references to the opened device must be made using the device handle.

### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name:</td>
<td>Points to an ASCII string that contains the name of a valid DCB/SC DSP device or board device.</td>
</tr>
<tr>
<td>rfu:</td>
<td>Reserved for future use. Set this parameter to 0.</td>
</tr>
</tbody>
</table>
Valid device names are listed below, where x specifies the board number.

<table>
<thead>
<tr>
<th>Board</th>
<th>Valid Device Names</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DCB/320SC</td>
<td>dcbBxD1</td>
<td>DSP1 device handle</td>
</tr>
<tr>

<td>dcbBxD2</td>
<td>DSP2 device handle</td>
</tr>
<tr>
<td></td>
<td>dcbBxD3</td>
<td>DSP3 device handle</td>
</tr>
</tbody>
</table>

NOTES:
1. If a parent process opens a device and enables events, there is no guarantee that the child process will receive a particular event.
2. No action can be performed on a device until it is opened.

**Cautions**

This function fails when:
- The device name is invalid.
- The system has insufficient memory to complete the open.

**Example**

```c
#include <windows.h>
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#include "errno.h"

main()
{
  int bddevh;

  /* open board 1*/
  if ((bddevh = dcb_open("dcbB1", 0)) == -1) {
    printf("Cannot open device dcbB1. errno = %d\n", errno);
    exit(1);
  }
```
opens a device  

```c
opens a device
dcb_open()
```

} else
   printf("Board %s is OPEN\n", ATDV_NAMEP(bddevh));
/* Done processing - Close device */
if (dcb_close(bddevh) == -1) {
   printf("Cannot close dcbB1 : errno = %d\n", errno);
   exit(1); 
}

■ Errors

The `dcb_open()` function does not return errors in the standard return code format. If an error occurred during the `dcb_open()` call, a -1 will be returned, and the specific error number will be returned in the `errno` global variable. If a call to `dcb_open()` is successful, the return value will be a handle for the opened device.

■ See Also

- `dcb_close()`
### `dcb_remfromconf()`

**Name:** `int dcb_remfromconf(devh, confid, cdt)`

**Inputs:**
- `int devh`
- `int confid`
- `MS_CDT *cdt`

- DCB/SC DSP device handle
- conference ID
- pointer to conference descriptor table element

**Returns:**
- 0 if success
- -1 if failure

**Includes:**
- `srllib.h`
- `dtilib.h`
- `msilib.h`
- `dcblib.h`

**Category:** Conference Management

**Mode:** synchronous

---

#### Description

The `dcb_remfromconf()` function removes a conferee from a conference. The conference ID is the value previously returned by the `dcb_estconf()` function. In this case, the channel attributes of the MS_CDT structure are ignored. For a full description of the MS_CDT structure, see the `dcb_estconf()` function.

**NOTE:** Calling this function frees one resource.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>devh:</td>
<td>The DCB/SC DSP device handle.</td>
</tr>
<tr>
<td>confid:</td>
<td>The conference identifier number.</td>
</tr>
<tr>
<td>cdt:</td>
<td>Pointer to the conference descriptor table element.</td>
</tr>
</tbody>
</table>

**NOTE:** Dialogic recommends that the appropriate `xx_unlisten()` function be called before removing the SCbus time slot member.

#### Cautions

1. An error will be returned if this function is used to attempt removal of the last remaining conferee from a conference. The `dcb_delconf()` function must be used to end a conference.
removes a conferee from a conference  \textit{dcb\_remfromconf()}

2. This function also fails when:
   \begin{itemize}
   \item The device handle passed is invalid.
   \item The conference ID is invalid.
   \item The conferee to be removed is not part of the specified conference.
   \end{itemize}

\section*{Example}

```c

---  

### Description

The `dcb_setbrdparm()` function sets DCB/SC board device parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>devh:</code></td>
<td>The valid board device handle returned by a call to <code>dcb_open()</code></td>
</tr>
<tr>
<td><code>param:</code></td>
<td>The parameter whose value is to be altered.</td>
</tr>
<tr>
<td><code>valuep:</code></td>
<td>The address of the integer or DCB_VOL structure containing the values to be assigned to the parameter.</td>
</tr>
</tbody>
</table>

Parameters are specified in the `param` field and may have the IDs and descriptions as shown below:

- **Active Talker Feature** (MSG_ACTID)  
  Active talker feature can be enabled or disabled by setting to ACTID_ON or ACTID_OFF.

- **Volume Control Digits** (MSG_VOLDIG)  
  Defines the volume control status and volume digits. Possible values are UP, DOWN, and RESET digits.
The parameters are disabled by default and must be enabled using the `dcb_setbrdparm()` function.

For MSG_ACTID, `valuep` points to an integer value. For MSG_VOLDIG, `valuep` points to an DCB_VOL structure defined as follows:

```c
typedef struct dcb_vol{  
    unsigned char vol_control; /* Feature status ON/OFF */  
    unsigned char vol_up;      /* Digit to increase volume */  
    unsigned char vol_reset;   /* Digit to reset volume to default level */  
    unsigned char vol_down;     /* Digit to decrease volume */  
}DCB_VOL;
```

`vol_control` indicates whether the volume control is turned ON or OFF. `vol_up` indicates the digit used for increasing the volume level. `vol_down` indicates the digit used for decreasing the volume, and `vol_reset` indicates the digit used to reset the volume level to the default.

### Cautions

1. All parameter values must be integers or DCB_VOL structures, but since this routine expects a void pointer to `valuep`, the address must be cast as a void*.

2. This function fails when:
   - The device handle is invalid.
   - The parameter specified is invalid.

### Example

```c
#include <windows.h>
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#include "errno.h"

main()
{
    int bddevh;      /* Board dev descriptor variables */
    int valuep = ACTID_ON;  /* Volume control */
    DCB_VOL volume;  /* Volume control */

    /* open DCB board 1 */
    if ( (bddevh = dcb_open("dcbB1", 0)) == -1 ) {
        printf("Cannot open device dcbB1. errno = \%d\n", errno);
        exit(1);
    }
```
```c
/* Enable Active talker feature */
if (dcb_setbrdparm(devh, MSG_ACTID, &valuep) == -1) {
    printf("Error setting board param:0x%lx",ATDV_LASTERR(devh));
    exit(1);
}

volume.vol_control = ON;
volume.vol_up = 2;
volume.vol_reset = 5;
volume.vol_down = 8;

if (dcb_setbrdparm(devh, MSG_VOLDIG, (void *)&volume) == -1) {
    printf("Error getting board param:0x%lx", ATDV_LASTERR(devh));
    exit(1);
}

/* Continue processing */

/* Done processing - Close device */
if (dcb_close(bddevh) == -1) {
    printf("Cannot close device dcbB1. errno = %d", errno);
    exit(1);
}
```

### Errors

If the function does not complete successfully, it will return -1 to indicate an error. Use the Standard Attribute functions `ATDV_LASTERR()` to obtain the applicable error value, or `ATDV_ERRMSGP()` to obtain a more descriptive error message.

Refer to the error type tables found in Chapter 2. *DCB/SC Library Function Overview* of this guide. Error defines can be found in `dtilib.h`, `msilib.h` or `dcblib.h`.

**Category:** Conference Management

**Mode:** synchronous

### Description

The dcb_setcde() function changes the attributes of a conferee in an existing conference.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>devh:</td>
<td>The DCB/SC DSP device handle.</td>
</tr>
<tr>
<td>Confid:</td>
<td>The conference identifier number.</td>
</tr>
<tr>
<td>Cdt:</td>
<td>Pointer to the conference descriptor table element.</td>
</tr>
</tbody>
</table>

The conference descriptor table is an array of the MS_CDT structure. The MS_CDT structure has the following format:

```c
typedef struct {
    int chan_num; /* SCbus time slot number */
    int chan_sel; /* time slot selector */
    int chan_attr; /* attribute description */
} MS_CDT;
```

The chan_num denotes the time slot number of the device to be included in the conference. The chan_sel defines the meaning of the chan_num. At present, chan_sel must be set to the following value:
changes the attributes of a conferee

dcb_setcde()

• MSPN_TS   SCbus time slot number

The chan_attr is a bitmask describing the conferee’s properties within the conference. It can have one or more of the following values ORed together:

• MSPA_NULL   No special attributes.
• MSPA_RO     Conferee participates in conference in receive-only mode.
• MSPA_TARIFF Conferee receives periodic tone for duration of call.
• MSPA_COACH  Conferee is a coach. Coach is heard by pupil only.
• MSPA_PUPIL   Conferee is a pupil. Pupil hears everyone including coach.

NOTE: If the conferee attributes of more than one conferee are to be set, this function must be called multiple times.

Table 6. Valid Attribute Combinations

<table>
<thead>
<tr>
<th>Pupil</th>
<th>Coach</th>
<th>Periodic Tone</th>
<th>Receive-only mode</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td></td>
<td></td>
<td>X</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Pupil</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Pupil</td>
</tr>
</tbody>
</table>

NOTES: 1. Only one coach and one pupil are allowed in a conference at any time.
2. The default MSPA_NULL must be used if channel attributes are not set.
3. Invalid attribute combinations may lead to unexpected results.
**dcb_setcde()** changes the attributes of a conferee

### Cautions

This function fails when:

- The device handle specified is invalid.
- The conference ID is invalid.

### Example

```c
#include <windows.h>
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#include "errno.h"

#define NUM_PARTIES 2

**Category:** Configuration

**Mode:** synchronous

### Description

The `dcb_setdigitmsk()` function enables specific digit detection for a conference. This current bitmask is examined by a call to `dcb_getdigitmsk()`.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>devh:</td>
<td>The DCB/SC DSP device handle.</td>
</tr>
<tr>
<td>confid:</td>
<td>The conference identifier.</td>
</tr>
<tr>
<td>bitmask:</td>
<td>The digit bitmask.</td>
</tr>
<tr>
<td>action:</td>
<td>Specifies how the digit mask is changed. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• CBA_SETMSK - enables notification of events specified in bitmask and disables notification of previously set events.</td>
</tr>
<tr>
<td></td>
<td>• CBA_ADDMSK - enables messages from the conference specified in bitmask, in addition to previously set events.</td>
</tr>
<tr>
<td></td>
<td>• CBA_SUBMSK - disables messages from the conference specified in bitmask.</td>
</tr>
</tbody>
</table>

**NOTE:** If MSG_VOLDIG is enabled to give transparent volume control to the conferees, the digits for volume increase, decrease, and reset will not
*dcb_setdigitmsk( )* enables specific digit detection

digit events to be generated. As a result, the application will not
know if the volume changes.

The *bitmask* determines the digits to be detected. Upon detection of a digit, a
DCBEV_DIGIT event is generated on a DCB/SC DSP handle. The
sr_getevtdatap( ) function can be used to retrieve the following structure:

```c
typedef struct {
    unsigned char dsp;                     /* DCB/SC DSP number */
    int confid;                           /* Conference ID */
    int chan_num;                         /* Channel/time slot number */
    int chan_sel;                         /* Meaning of chan_num */
    int chan_attr;                        /* Attribute of chan_num */
    unsigned char digits [DCB_MAXDIGS+1];  /* ASCIIZ string of detected digits */
    unsigned char dig_type;                /* Type of digits(s) detected */
} DCB_DIGITS;
```

The possible values for *bitmask* are:

- **CBMM_ZERO** Detect digit 0
- **CBMM_ONE** Detect digit 1
- **CBMM_TWO** Detect digit 2
- **CBMM_THREE** Detect digit 3
- **CBMM_FOUR** Detect digit 4
- **CBMM_FIVE** Detect digit 5
- **CBMM_SIX** Detect digit 6
- **CBMM_SEVEN** Detect digit 7
- **CBMM_EIGHT** Detect digit 8
- **CBMM_NINE** Detect digit 9
- **CBMM_STAR** Detect digit *
- **CBMM_POUND** Detect digit 
- **CBMM_A** Detect digit A
- **CBMM_B** Detect digit B
- **CBMM_C** Detect digit C
- **CBMM_D** Detect digit D
- **CBMM_ALL** Detect ALL digits

For example, to enable notification of the digits specified in the *bitmask*
parameter and disable notification of previously set digits:

- specify the digits to enable in the *bitmask* field
- specify the CBA_SETMSK *bitmask* in the *action* field
enables specific digit detection

**dcb_setdigitmsk( )**

To enable an additional digit specified in **bitmask** without disabling the currently enabled digits:

- specify the digits in **bitmask**
- specify CBA_ADDMSK in the **action** field

To disable digits in **bitmask** without disabling any other digits:

- specify the digits in **bitmask**
- specify CBA_SUBMSK in the **action** field

To disable all currently enabled digits:

- specify 0 in **bitmask**
- specify CBA_SETMSK in the **action** field

To enable an event handler for a specified event, follow these steps:

1. **Call sr_enbhdlr( )**. This function specifies the event and the application defined event handler that is called from a signal handler.
2. **Call dcb_setdigitmsk( )**. This function sets the digit message mask.

**NOTE:** The request for an event to be posted to an event handler must be specified using both the **sr_enbhdlr( )** and **dcb_setdigitmsk( )** functions.

### Cautions

This function fails when:

- The device handle specified is invalid.
- The action specified is invalid.
- Invalid conference ID.

### Example

```c
#include <windows.h>
#include <stdio.h>
#include "srilib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#include "errno.h"
```
dcb_setdigitmsk( ) enables specific digit detection

#include "dcb.h"

#define NUM_PARTIES 2

    cdt[0].chan_sel = MSPN_TS; /* by dt_getxmitslot() */
    cdt[0].chan_attr = MSPA_TARIFF; /* Conferee receives periodic tariff tones */

    /* Open board 1, tslot 2 */
    if ((tsdevh2 = dt_open("dtiB1T2", 0)) == -1) {
        printf("Cannot open dtiB1T2 : errno = %d", errno);
        exit(1);
    }

    /* Prepare the time slot information structure */
    tsinfo.sc_numts = 1;
    tsinfo.sc_tsarrayp = &scts;

    /* Retrieve the SCbus transmit time slot for tsdevh2 */
    if (dt_getxmitslot(tsdevh2, &tsinfo) == -1){
        printf("Error Message : %s", ATDV_ERRMSGP(tsdevh2));
        exit(1);
    }

    /* Set up the MS_CDT structure */
    cdt[1].chan_num = (int)scts; /* SCbus time slot returned */
    cdt[1].chan_sel = MSPN_TS; /* by dt_getxmitslot() */
    cdt[1].chan_attr = MSPA_TARIFF; /* Conferee receives periodic tariff tones */

    /* Establish a 2 party conference */
    if (dcb_estconf(dspdevh, cdt, NUM_PARTIES, MSCA_ND, &confid) == 1) {
        printf("Error Message : %s", ATDV_ERRMSGP(dspdevh));
    }
}

96
enables specific digit detection

dcb_setdigitmsk()

`dcb_setdigitmsk` enables specific digit detection.

```c
if(dcb_close(dspdevh) == -1) {
    printf("Cannot close dcbB1D2 : errno = %d", errno);
    exit(1);
}
```

### Errors

If the function does not complete successfully, it will return -1 to indicate an error. Use the Standard Attribute functions `ATDV_LASTERR` to obtain the applicable error value, or `ATDV_ERRMSGP` to obtain a more descriptive error message.

Refer to the error type tables found in Chapter 2, *DCB/SC Library Function Overview* of this guide. Error defines can be found in `dtilib.h`, `msilib.h` or `dcblib.h`.

\hspace{1cm} dbllib.h
\item \textbf{Category:} Conference Management
\item \textbf{Mode:} synchronous
\end{itemize}

\section*{Description}

The \texttt{dcb\_unmonconf( )} function removes a monitor from a conference.

\begin{center}
\begin{tabular}{lc}
\textbf{Parameter} & \textbf{Description} \\
\hline
devh: & The DCB/SC DSP device handle. \\
confid: & The conference identifier. \\
\end{tabular}
\end{center}

\textbf{NOTES:}  
1. Calling this function frees one resource.
2. Dialogic recommends that the appropriate \texttt{xx\_unlisten( )} function be called for each conferee listening to the monitored signal before \texttt{dcb\_unmonconf( )} is called.

\section*{Cautions}

This function fails when:
\begin{itemize}
\item The device handle specified is invalid.
\item It is called for a non-DCB/SC board.
\item An invalid conference is specified.
\item A monitor does not exist in the conference.
\end{itemize}
`dcb_unmonconf()` removes a monitor from a conference

### Example

```c
#include <windows.h>
#include <stdio.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
#include "errno.h"

#define NUM_PARTIES 2

main()
{
    int dspdevh; /* DCB/SC DSP device handle */
    MS_CDT cdt[NUM_PARTIES]; /* Conference descriptor table */
    int confid; /* Conference ID */
    int tsdevh1, tsdevh2, tsdevh3; /* DTI time slot device handles */
    long lts, scts; /* listen/transmit time slots */
    SC_TSINFO tsinfo; /* Time slot information structure */

    /* Open DCB/SC board 1, DSP 1 device */
    if ((dspdevh = dcb_open("dcbB1D1",0)) == -1) {
        printf("Cannot open dcbB1D1 : errno = %d", errno);
        exit(1);
    }

    /* Open DTI board 1, time slot 1 */
    if ((tsdevh1 = dt_open("dtiB1T1",0)) == -1) {
        printf( "Cannot open dtiB1T1 : errno = %d", errno);
        exit(1);
    }

    /* Prepare the time slot information structure */
    tsinfo.sc_numts = 1;
    tsinfo.sc_tsarrayp = &scts;

    /* Get transmit time slot of DTI tsdevh1 */
    if (dt_getxmitslot(tsdevh1, &tsinfo) == -1){
        printf("Error Message : %s", ATDV_ERRMSGP(tsdevh1));
        exit(1);
    }

    /* Set up CDT structure */
    cdt[0].chan_num = (int)scts; /* SCbus time slot returned */
    cdt[0].chan_sel = MSMP_TS; /* by dt_getxmitslot() */
    cdt[0].chan_attr = MSPA_NULL; /* Conferee has no special attributes */

    /* Open DTI board 1, time slot 2 */
    if ((tsdevh2 = dt_open("dtiB1T2",0)) == -1) {
        printf("Cannot open dtiB1T2 : errno = %d", errno);
        exit(1);
    }

    /* Open board 1, time slot 3 */
    if ((tsdevh3 = dt_open("dtiB1T3",0)) == -1) {
        printf("Cannot open dtiB1T3: errno=%d", errno);
        exit(1);
    }

    /* get transmit time slot of DTI TS device 2 */
    if (dt_getxmitslot(tsdevh2, &tsinfo) == -1){
        printf("Error Message : %s", ATDV_ERRMSGP(tsdevh2));
        exit(1);
    }
}
```
removes a monitor from a conference  

```c
  printf("Error Message : ts*, ATDV_ERRMSGP(tsdenvh2));
  exit(1);
}
/* Set up CDT structure */
cdt[1].chan_num = (int)scts; /* SCbus time slot returned */
cdt[1].chan_sel = MSPN_TS; /* by dt_getxmitslot() */
cdt[1].chan_attr = MSPA_NULL; /* Conferee has no special attributes */
/* Establish a 2 party conference */
if (dcb_estconf(dspdevh, cdt, NUM_PARTIES, MSCA_ND, &confid) == -1){
  printf("Error Message : ts*, ATDV_ERRMSGP(dspdevh));
  exit(1);
}
/* Do a listen for the DTI tsdevh1 device */
 tsinfo.sc_numts = 1;
 tsinfo.sc_tsarrayp = &cdt[0].chan_lts;
 if (dt_listen(tsdenvh1,&tsinfo) == -1){
   printf("Error Message : ts*, ATDV_ERRMSGP(tsdenvh1));
   exit(1);
 }
/* Do a listen for the DTI tsdevh2 device */
 tsinfo.sc_numts = 1;
 tsinfo.sc_tsarrayp = &cdt[1].chan_lts;
 if (dt_listen(tsdenvh2,&tsinfo) == -1){
   printf("Error Message : ts*, ATDV_ERRMSGP(tsdenvh2));
   exit(1);
 }
/* Now monitor the conference on SCbus time slot lts */
if (dcb_monconf(dspdevh, confid, &lts)) == -1){
  printf("Error Message : ts*, ATDV_ERRMSGP(dspdevh));
  exit(1);
}
/* Prepare a time slot info structure */
 tsinfo.sc_numts = 1;
 tsinfo.sc_tsarrayp = &lts;
/* And let a DTI time slot, tsdevh3, monitor the conference */
 if (dt_listen(tsdenvh3,&tsinfo) == -1){
   printf("Error Message : ts*, ATDV_ERRMSGP(tsdenvh3));
   exit(1);
 }
/* Perform an 'unlisten' for the DTI time slot */
 if (dt_unlisten(tsdenvh3) == -1){
   printf("Error Message : ts*, ATDV_ERRMSGP(tsdenvh3));
   exit(1);
 }
/* Now remove the monitoring */
if (dcb_unmonconf(dspdevh,confid)) == -1}{
  printf("Error Message : ts*, ATDV_ERRMSGP(dspdevh));
  exit(1);
}
/* Perform 'unlistens' for the remaining DTI time slots */
if (dt_unlisten(tsdenvh1) == -1){
  printf("Error Message : ts*, ATDV_ERRMSGP(dspdevh));
  exit(1);
}
```
**dcb_unmonconf( )** removes a monitor from a conference

```c
printf("Error Message : %s", ATDV_ERRMSGP(tsdevh1));
exit(1);
}
if (dt_unlisten(tsdevh2) == -1){
    printf("Error Message : %s", ATDV_ERRMSGP(tsdevh2));
    exit(1);
}

/* Delete the conference */
if(dcb_delconf(dspdevh, confid) == -1) {
    printf("Cannot delete conference %d : Error Message = %s", confid,
            ATDV_ERRMSGP(dspdevh));
    exit(1);
}

/* And close all open devices */
if (dt_close(tsdevh1) == -1){
    printf("Error closing tsdevh1\n");
    exit(1);
}
if (dt_close(tsdevh2) == -1){
    printf("Error closing tsdevh2\n");
    exit(1);
}
if (dt_close(tsdevh3) == -1){
    printf("Error closing tsdevh3\n");
    exit(1);
}
if (dcb_close(dspdevh) == -1){
    printf("Cannot close dcbB1D1 : errno = %d\n", errno);
    exit(1);
}
```

### Errors

If the function does not complete successfully, it will return -1 to indicate an error. Use the Standard Attribute functions **ATDV_LASTERR( )** to obtain the applicable error value, or **ATDV_ERRMSGP( )** to obtain a more descriptive error message.

Refer to the error type tables found in *Chapter 2. DCB/SC Library Function Overview* of this guide. Error defines can be found in *ditib.h, msilib.h* or *dcbilb.h*.

4. Application Guidelines

This chapter contains suggestions to guide programmers in designing and coding a Dialogic DCB/SC application for Windows NT.

4.1. Writing a Simple Application

This section provides DCB/SC general and task-specific programming guidelines:

- General Guidelines
- Initialization
- Compiling and Linking
- Aborting

**NOTE:** These guidelines are not a comprehensive guide to developing or debugging DCB/SC applications. The examples following each function description in Chapter 3. Function Reference illustrate proper use of the DCB/SC functions.

4.1.1. General Guidelines

The following general guidelines for writing Dialogic applications are explained in this section:

- Using symbolic defines
- Including header files
- Checking return codes

**Using Symbolic Defines**

Dialogic does not guarantee the numerical values of defines will remain the same as new versions of a software package are released. In general, do not use a numerical value in your application when an equivalent symbolic define is available. Symbolic defines are found in the *dilib.h*, *msilib.h*, and *dcplib.h* files.
Including Header Files

Various header files must be included in your application to test for error conditions, to use library functions from other Dialogic products, or to perform event-management and standard-attribute functions. An example is shown below. See Chapter 2. DCB/SC Library Function Overview for details.

```c
#include <windows.h>
#include <errno.h>
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcblib.h"
```

**NOTE:** To avoid redundancy in the remaining programming examples in this chapter, #include statements will not be shown.

Checking Return Codes

Most Network and DCB/SC Windows NT library functions return a value of -1 if they fail (extended attribute functions return AT_FAILURE or AT_FAILUREP if they fail). Any call to a library function should therefore check for a return value indicating an error. This can be done using a format similar to the following:

```c
/* call to Dialogic DCB/SC library function */
if (dcb_xxx(arguments) == -1) {
    /* error handling routine */
}
/* successful function call - continue processing ... */
```

Using this technique ensures that all errors resulting from a library call will be trapped and handled properly by the application. In many cases, you can check for a return value of other than zero (0), as shown in the example below. However, this should only be used where a non-zero value is returned when the function fails. For details, see Chapter 2. DCB/SC Library Function Overview and Chapter 3. Function Reference.

```c
/* error handling routine */
void do_error( devh, funcname )
int devh;                 /* Dialogic device handle */
char *funcname;           /* function name */
{
    int errorval = ATDV_LASTERR( devh );
    printf( "Error while calling function %s on device %s. \n", funcname,
            ATDV_NAMEP( devh ) );
    if ( errorval == EDT_SYSTEM ) {
```
printf("errno = %d\n", errno);
    { invalid call remove}
} else {
    printf("Error value = %d\nError message = %s\n",
        errorval, ATDV_ERRMSGP( devh ));
}
    return;
}

main( )
{
    
    /* example call to Dialogic DCB/SC library function */
    if (dcb_setdigitmsk( devh, confid, CBMM_ALL)!= 0) {
        do_error( devh, "dcb_setdigitmsk()" );
    }
    /* successful function call - continue processing */
    
    NOTE: Calls to dcb_open() return either -1 or a non-zero device handle. Therefore, when issuing the dcb_open() function, check for a return of -1. The specific error can be found in the global variable errno, contained in errno.h.

4.1.2. Initialization

As a first step, a DCB/SC application must initialize parameters.

Set Configuration

Use dcb_setbrdparm() to set active talker and volume control digits. Specific setting choices include:

- **Active Talker Feature (MSG_ACTID)**: Active Talker feature can be enabled or disabled by setting to ACTID_ON or ACTID_OFF.
- **Volume Control Digits (MSG_VOLDIG)**: Defines the volume control status and volume up/down/reset digits.

If the resource assignment table updates are desired by the application, enable event generation using dcb_evtstatus().
4.1.3. Terminating

When your process completes, devices should be shut down in an orderly fashion. Tasks that are performed to terminate an application generally include:

- Disabling events
- Stop listening to time slots
- Deleting all conferences
- Closing devices

**NOTE:** SRL Event Management functions (such as `sr_dishdlr()`, which disables an event handler) must be called before closing the device that is sending the handler event notifications (see Appendix A for SRL details).

4.1.4. Compiling and Linking

To compile and link your application, follow the instructions for your version of the Windows NT Compiler.

If using Microsoft Visual C++, link with the following libraries when using the DCB/SC board:

`libsrmlt.lib`  
`libdtmt.lib`

By default, the files are found in `<install drive%>:<install directory>/dialogic/lib`. Depending on your application, you may need to link with other libraries. Refer to the appropriate documentation for other Dialogic products.

If using Borland C++, you must include the cross-compatibility library files in your file set. The files are found in `<install drive%>:<install directory>/dialogic/lib`. You may also use the x-compatibility files when using Microsoft Visual C++.

4.1.5. Aborting

If you abort a DCB/SC Windows NT application by pressing the interrupt key, the Windows NT system will terminate the current process but may leave devices in an unknown state. As a result, you may encounter errors the next time the application runs.
4. Application Guidelines

To avoid errors of this type, your application should include an event handler that traps the interrupt key and performs the actions listed in Section 4.1.3. 

Terminating.
Appendix A

Standard Runtime Library: DCB/SC Entries and Returns

The Standard Runtime Library is a device-independent library containing Event Management functions, Standard Attribute functions, and the DV_TPT Termination Parameter table. SRL functions and data structures are described in detail in the Standard Runtime Library Programmer’s Guide and the Voice Software Reference for Windows NT.

This appendix lists the DCB/SC entries and returns for each of the Standard Runtime Library (SRL) components.

Table 7. Guide to Appendix A

<table>
<thead>
<tr>
<th>SRL Component</th>
<th>DCB/SC Data Listed in Appendix A</th>
</tr>

<td>DCB/SC values returned by the Standard Attribute functions.</td>
</tr>
<tr>
<td>DV_TPT table</td>
<td>Termination conditions and related data.</td>
</tr>
<tr>
<td></td>
<td>Not used by the DCB/SC device.</td>
</tr>
</tbody>
</table>

NOTE: The header file for this library is srllib.h. It must be included in the application code prior to including dtilib.h, dcllib.h, and msilib.h. For example:

```
#include "srllib.h"
#include "dtilib.h"
#include "msilib.h"
#include "dcllib.h"
```
Event Management Functions

The Event Management functions retrieve and handle DCB/SC events. The functions are listed in the following tables.

Glossary

**analog:** In this guide, analog refers to agent communications between a headset or a telephone and the MSI/SC or to the loop-start type of network interface.

**asynchronous function:** Allows program execution to continue without waiting for a task to complete. See *synchronous function*.

**baseboard:** A term used in voice processing to mean a printed circuit board without any daughterboards attached.

**channel:** 1. When used in reference to a Dialogic digital expansion board, a data path, or the activity happening on that data path. 2. When used in reference to the CEPT telephony standard, one of 32 digital data streams (30 voice, 1 framing, 1 signaling) carried on the 2.048 Mhz/sec E-1 frame. (See *time slot.*) 3. When used in reference to a bus, an electrical circuit carrying control information and data.

**data structure:** C programming term for a data element consisting of fields, where each field may have a different type definition and length. The elements of a data structure usually share a common purpose or functionality, rather than being similar in size, type, etc.

**daughterboard:** In the context of this guide, the DCB/SC daughterboard assembly. The daughterboard enables the DCB/SC hardware to interface to analog station devices.

**DCB/SC:** The Dialogic single slot, DSP-based conferencing solution. Each product in the DCB/SC series contains one, two, or three DSP(s). Each Digital Signal Processor (DSP) supports up to 32 conferees, for a maximum of 96 (3 sets of 32) conferencing resources.

**device:** Any computer peripheral or component that is controlled through a software device driver.

**digital:** Information represented as binary code.

**DIP switch:** A switch usually attached to a printed circuit board with two settings- on or off. DIP switches are used to configure the board in a semipermanent way.

**driver:** A software module that provides a defined interface between a program and the hardware.
**Dialogic Audio Conferencing Software Reference for Windows NT**

**DTMF:** Dual Tone Multi-Frequency. DTMF refers to the combination of two tones which represents a number on a telephone key pad. Each pushbutton has its own unique combination of tones.

**E-1:** Another name given to the CEPT digital telephony format devised by the CCITT that carries data at the rate of 2.048 Mbps (DS-1 level). This service is available in Europe and some parts of Asia.

**event:** An unsolicited communication from a hardware device to an operating system, application, or driver. Events are generally attention-getting messages, allowing a process to know when a task is complete or when an external event occurs.

**Extended Attribute functions:** Class of functions that take one input parameter (a valid Dialogic device handle) and return device-specific information.

**host PC:** The system PC in which Dialogic hardware and software are installed and applications are run and/or developed.

**loop start interfaces:** Devices, such as an analog telephones, that receive an analog electric current. For example, taking the receiver off hook closes the current loop and initiates the calling process.

**MSI:** Modular Station Interface. A PEB-based Dialogic expansion board that interfaces PEB time slots to analog station devices by way of modular daughterboards.

**MSI/SC:** Modular Station Interface. An SCbus-based Dialogic expansion board that interfaces SCbus time slots to analog station devices.

**PC:** Personal computer. In this guide, the term refers to an IBM Personal Computer or compatible machine.

**rfu:** Reserved for future use.

**SCbus:** Signal Computing bus. A hardwired connection between Switch Handlers (SC2000 chips) on SCbus-based products for transmitting information over 1024 time slots to all devices connected to the SCbus.

**SCSA:** Signal Computing System Architecture. A generalized open-standard architecture describing the components and specifying the interfaces for a signal processing system for the PC-based voice processing, call processing and telecom switching industry.

**Signal Computing System Architecture:** See SCSA.
Glossary

**Standard Attribute functions:** Class of functions that take one input parameter (a valid Dialogic device handle) and return generic information about the device. The Dialogic SRL contains Standard Attribute functions for all Dialogic devices. Standard Attribute function names are case-sensitive and must be in capital letters. See *Extended Attribute functions*.

**synchronous function:** Blocks program execution until a value is returned by the device. Also called a blocking function. See *asynchronous function*.
