## CS 4110

Programming Languages \& Logics

## Lecture 23 <br> Type Inference

26 October 2016

## Announcements

- HW \#6 due tonight at 11:59pm We made one problem easier! Please see Piazza.
- HW \#7 out now
- My office hours: Thursday instead of Friday (2-3pm)

## Review: Polymorphic $\lambda$-Calculus

Syntax

$$
\begin{aligned}
& e::=n|x| \lambda x: \tau . e\left|e_{1} e_{2}\right| \Lambda X . e \mid e[\tau] \\
& v::=n|\lambda x: \tau . e| \Lambda X . e
\end{aligned}
$$

Dynamic Semantics

$$
E::=[\cdot]|E e| v E \mid E[\tau]
$$

$\overline{(\lambda x: \tau . e) v \rightarrow e\{v / x\}}$
$\overline{(\Lambda X . e)[\tau] \rightarrow e\{\tau / X\}}$

## Review: Polymorphic $\lambda$-Calculus

$$
\begin{array}{rc}
\frac{\Gamma(x)=\tau}{\Delta, \Gamma \vdash n: \text { int }} & \frac{\Gamma, \Gamma \vdash x: \tau}{} \\
\frac{\Delta, \Gamma, x: \tau \vdash e: \tau^{\prime} \quad \Delta \vdash \tau \text { ok }}{\Delta, \Gamma \vdash \lambda x: \tau . e: \tau \rightarrow \tau^{\prime}} & \frac{\Delta, \Gamma \vdash e_{1}: \tau \rightarrow \tau^{\prime} \quad \Delta, \Gamma \vdash e_{2}: \tau}{\Delta, \Gamma \vdash e_{1} e_{2}: \tau^{\prime}} \\
\frac{\Delta \cup\{X\}, \Gamma \vdash e: \tau}{\Delta, \Gamma \vdash \Lambda X . e: \forall X . \tau} & \frac{\Delta, \Gamma \vdash e: \forall X \cdot \tau^{\prime} \quad \Delta \vdash \tau \text { ok }}{\Delta, \Gamma \vdash e[\tau]: \tau^{\prime}\{\tau / X\}}
\end{array}
$$

## Review: Polymorphic $\lambda$-Calculus

Polymorphism let us write a doubling function that works for any type of function:

$$
\text { double } \triangleq \Lambda X . \lambda f: X \rightarrow X . \lambda x: X . f(f x) .
$$

The type of this expression is:

$$
\forall X .(X \rightarrow X) \rightarrow X \rightarrow X
$$

You can use the polymorphic function by providing a type: double [int] $(\lambda n: \mathbf{i n t} . n+1) 7$

## Type Inference

In languages like OCaml, programmers don't have to annotate their programs with $\forall X$. $\tau$ or e $[\tau]$.

## Type Inference

In languages like OCaml, programmers don't have to annotate their programs with $\forall X$. $\tau$ or $e[\tau]$.

For example, we can write:
let double $\mathrm{f} x=\mathrm{f}$ (f x )
and OCaml will figure out that the type is:
$(' a \rightarrow$ 'a) $\rightarrow$ 'a $\rightarrow$ 'a
which is equivalent to the same System F type:

$$
\forall A .(A \rightarrow A) \rightarrow A \rightarrow A
$$

## Type Inference

In languages like OCaml, programmers don't have to annotate their programs with $\forall X$. $\tau$ or $e[\tau]$.

We can also write
double (fun $\mathrm{x} \rightarrow \mathrm{x}+1$ ) 7
and OCaml will infer that the polymorphic function double is instantiated at the type int.

## ML Polymorphism

However, polymorphism in OCaml and other MLs, has some restrictions to ensure that type inference remains decidable.

## ML Polymorphism

However, polymorphism in OCaml and other MLs, has some restrictions to ensure that type inference remains decidable.

These restrictions, called prenex polymorphism, stipulate that $\forall \mathrm{s}$ may only appear in the "outermost" position.

## ML Polymorphism

However, polymorphism in OCaml and other MLs, has some restrictions to ensure that type inference remains decidable.

These restrictions, called prenex polymorphism, stipulate that $\forall \mathrm{s}$ may only appear in the "outermost" position.

Examples

- Prenex: $\forall \alpha . \alpha \rightarrow \alpha$

## ML Polymorphism

However, polymorphism in OCaml and other MLs, has some restrictions to ensure that type inference remains decidable.

These restrictions, called prenex polymorphism, stipulate that $\forall s$ may only appear in the "outermost" position.

## Examples

- Prenex: $\forall \alpha . \alpha \rightarrow \alpha$
- Not prenex: $(\forall \alpha . \alpha \rightarrow \alpha) \rightarrow$ int
- Not prenex: $(\forall \alpha . \alpha \rightarrow \alpha) \rightarrow$ int

## ML Polymorphism

However, polymorphism in OCaml and other MLs, has some restrictions to ensure that type inference remains decidable.

These restrictions, called prenex polymorphism, stipulate that $\forall s$ may only appear in the "outermost" position.

## Examples

- Prenex: $\forall \alpha . \alpha \rightarrow \alpha$
- Not prenex: $(\forall \alpha . \alpha \rightarrow \alpha) \rightarrow$ int
- Not prenex: $(\forall \alpha . \alpha \rightarrow \alpha) \rightarrow$ int

These restrictions have the following practical ramifications:

- Can't instantiate type variables with polymorphic types
- Can't put a polymorphic type on the left of an arrow

## Example

These restrictions mean that certain terms that are typeable in System F are not typeable in ML!

## Example

These restrictions mean that certain terms that are typeable in System F are not typeable in ML!

OCaml version 4.01.0
\# fun $x$-> $x$ x;
Error: This expression has type 'a -> 'b but an expression was expected of type 'a The type variable 'a occurs inside 'a -> 'b

## Type Inference

Type inference may be undecidable for the polymorphic $\lambda$-calculus and OCaml, but it is possible for the simply-tpyed $\lambda$-calculus!

## Type Inference

Type inference may be undecidable for the polymorphic $\lambda$-calculus and OCaml, but it is possible for the simply-tpyed $\lambda$-calculus!

Type inference for the STLC means guessing a $\tau$ in every abstraction in an untyped version:

$$
\lambda x . e
$$

to produce a typed program:

$$
\lambda x: \tau . e
$$

that we can use in the typing rule for functions.

## Example

Here's an untyped program:
$\lambda a$. $\lambda b$. $\lambda c$. if $a(b+1)$ then $b$ else $c$

## Example

Here's an untyped program:
$\lambda a$. $\lambda b$. $\lambda c$. if $a(b+1)$ then $b$ else $c$

Informal inference:

## Example

Here's an untyped program:
$\lambda a$. $\lambda b$. $\lambda c$. if $a(b+1)$ then $b$ else $c$

Informal inference:

- $b$ must be int

## Example

Here's an untyped program:
$\lambda a$. $\lambda b$. $\lambda c$. if $a(b+1)$ then $b$ else $c$
Informal inference:

- $b$ must be int
- $a$ must be some kind of function

## Example

Here's an untyped program:
$\lambda a$. $\lambda b$. $\lambda c$. if $a(b+1)$ then $b$ else $c$
Informal inference:

- $b$ must be int
- $a$ must be some kind of function
- the argument type of $a$ must be the same as $b+1$

## Example

Here's an untyped program:
$\lambda a . \lambda b$. $\lambda c$. if $a(b+1)$ then $b$ else $c$

Informal inference:

- $b$ must be int
- a must be some kind of function
- the argument type of $a$ must be the same as $b+1$
- the result type of $a$ must be bool

## Example

Here's an untyped program:
$\lambda a . \lambda b$. $\lambda c$. if $a(b+1)$ then $b$ else $c$

Informal inference:

- $b$ must be int
- a must be some kind of function
- the argument type of $a$ must be the same as $b+1$
- the result type of $a$ must be bool
- the type of $c$ must be the same as $b$

## Example

Here's an untyped program:
$\lambda a . \lambda b$. $\lambda c$. if $a(b+1)$ then $b$ else $c$

Informal inference:

- $b$ must be int
- a must be some kind of function
- the argument type of $a$ must be the same as $b+1$
- the result type of $a$ must be bool
- the type of $c$ must be the same as $b$

Putting all these pieces together:
$\lambda a:$ int $\rightarrow$ bool. $\lambda b$ :int. $\lambda c:$ int. if $a(b+1)$ then $b$ else $c$

## Constriant-Based Inference

Let's automate type inference!

## Constriant-Based Inference

Let's automate type inference!
We introduce a new judgment:

$$
\Gamma \vdash e: \tau \mid C
$$

Given a typing context $\Gamma$ and an expression $e$, it generates a set of constraints-equations between types.

## Constriant-Based Inference

Let's automate type inference!
We introduce a new judgment:

$$
\Gamma \vdash e: \tau \mid C
$$

Given a typing context $\Gamma$ and an expression $e$, it generates a set of constraints-equations between types.

If these constraints are solvable, then e can be well-typed in $\Gamma$.
A solution to a set of constraints is a type substitution $\sigma$ that, for each equation, makes both sides syntactically equal.

## STLC for Type Inference

Let's define the type inference judgment for this STLC language:

$$
\begin{aligned}
& e::=x|\lambda x: \tau . e| e_{1} e_{2}|n| e_{1}+e_{2} \\
& \tau::=\text { int }|x| \tau_{1} \rightarrow \tau_{2}
\end{aligned}
$$

You can use a type variable $X$ wherever you want to have a type inferred.

## Constraint-Based Typing Judgment

$$
\frac{x: \tau \in \Gamma}{\Gamma \vdash x: \tau \mid \emptyset} \text { CT-VAR }
$$

## Constraint-Based Typing Judgment

$$
\frac{x: \tau \in \Gamma}{\Gamma \vdash x: \tau \mid \emptyset} \text { CT-VAR }
$$

$\overline{\Gamma \vdash n: \text { int } \mid \emptyset}$ CT-INT

## Constraint-Based Typing Judgment

$$
\begin{gathered}
\frac{x: \tau \in \Gamma}{\Gamma \vdash x: \tau \mid \emptyset} \text { CT-VAR } \quad \overline{\Gamma \vdash n: \mathbf{i n t} \mid \emptyset} \text { CT-INT } \\
\frac{\Gamma \vdash e_{1}: \tau_{1}\left|C_{1} \quad \Gamma \vdash e_{2}: \tau_{2}\right| C_{2}}{\Gamma \vdash e_{1}+e_{2}: \mathbf{i n t} \mid C_{1} \cup C_{2} \cup\left\{\tau_{1}=\text { int }, \tau_{2}=\mathbf{i n t}\right\}} \text { CT-ADD }
\end{gathered}
$$

## Constraint-Based Typing Judgment

$$
\begin{gathered}
\frac{x: \tau \in \Gamma}{\Gamma \vdash x: \tau \mid \emptyset} \text { CT-VAR } \quad \overline{\Gamma \vdash n: \mathbf{i n t} \mid \emptyset} \text { CT-INT } \\
\frac{\Gamma \vdash e_{1}: \tau_{1}\left|C_{1} \quad \Gamma \vdash e_{2}: \tau_{2}\right| C_{2}}{\Gamma \vdash e_{1}+e_{2}: \mathbf{i n t} \mid C_{1} \cup C_{2} \cup\left\{\tau_{1}=\mathbf{i n t}, \tau_{2}=\mathbf{i n t}\right\}} \text { CT-ADD } \\
\frac{\Gamma, x: \tau_{1} \vdash e: \tau_{2} \mid C}{\Gamma \vdash \lambda x: \tau_{1} . e: \tau_{1} \rightarrow \tau_{2} \mid C} \text { CT-ABS }
\end{gathered}
$$

## Constraint-Based Typing Judgment

$$
\begin{gathered}
\frac{x: \tau \in \Gamma}{\Gamma \vdash x: \tau \mid \emptyset} \mathrm{CT}-\mathrm{VAR} \quad \overline{\Gamma \vdash n: \mathbf{i n t} \mid \emptyset} \mathrm{CT}-\mathrm{INT} \\
\frac{\Gamma \vdash e_{1}: \tau_{1}\left|C_{1} \quad \Gamma \vdash e_{2}: \tau_{2}\right| C_{2}}{\Gamma \vdash e_{1}+e_{2}: \mathbf{i n t} \mid C_{1} \cup C_{2} \cup\left\{\tau_{1}=\mathbf{i n t}, \tau_{2}=\mathbf{i n t}\right\}} \mathrm{CT}-\mathrm{AdD} \\
\frac{\Gamma, x: \tau_{1} \vdash e: \tau_{2} \mid C}{\Gamma \vdash \lambda x: \tau_{1} \cdot e: \tau_{1} \rightarrow \tau_{2} \mid C} \mathrm{CT}-\mathrm{ABS} \\
\frac{\Gamma \vdash e_{1}: \tau_{1}\left|C_{1} \quad \Gamma \vdash e_{2}: \tau_{2}\right| C_{2}}{\Gamma \text { fresh } C^{\prime}=C_{1} \cup C_{2} \cup\left\{\tau_{1}=\tau_{2} \rightarrow X\right\}} \\
\Gamma \vdash e_{1} e_{2}: X \mid C^{\prime} \\
\text { CT-APP }
\end{gathered}
$$

## Solving Constraints

A type substitution is a finite map from type variables to types.
Example: The substitution
$[X \mapsto$ int,$Y \mapsto$ int $\rightarrow$ int $]$ maps type variable $X$ to int and $Y$ to int $\rightarrow$ int.

## Type Substitution

We can define substitution of type variables formally:

## Type Substitution

We can define substitution of type variables formally:

$$
\sigma(X)= \begin{cases}\tau & \text { if } X \mapsto \tau \in \sigma \\ X & \text { if } X \text { not in the domain of } \sigma\end{cases}
$$

## Type Substitution

We can define substitution of type variables formally:

$$
\begin{aligned}
\sigma(X) & = \begin{cases}\tau & \text { if } X \mapsto \tau \in \sigma \\
X & \text { if } X \text { not in the domain of } \sigma\end{cases} \\
\sigma(\mathbf{i n t}) & =\mathbf{i n t}
\end{aligned}
$$

## Type Substitution

We can define substitution of type variables formally:

$$
\begin{aligned}
\sigma(X) & = \begin{cases}\tau & \text { if } X \mapsto \tau \in \sigma \\
X & \text { if } X \text { not in the domain of } \sigma\end{cases} \\
\sigma(\mathbf{i n t}) & =\text { int } \\
\sigma\left(\tau \rightarrow \tau^{\prime}\right) & =\sigma(\tau) \rightarrow \sigma\left(\tau^{\prime}\right)
\end{aligned}
$$

## Type Substitution

We can define substitution of type variables formally:

$$
\begin{aligned}
\sigma(X) & = \begin{cases}\tau & \text { if } X \mapsto \tau \in \sigma \\
X & \text { if } X \text { not in the domain of } \sigma\end{cases} \\
\sigma(\text { int }) & =\text { int } \\
\sigma\left(\tau \rightarrow \tau^{\prime}\right) & =\sigma(\tau) \rightarrow \sigma\left(\tau^{\prime}\right)
\end{aligned}
$$

We don't need to worry about avoiding variable capture: all type variables are "free."

## Type Substitution

We can define substitution of type variables formally:

$$
\begin{aligned}
\sigma(X) & = \begin{cases}\tau & \text { if } X \mapsto \tau \in \sigma \\
X & \text { if } X \text { not in the domain of } \sigma\end{cases} \\
\sigma(\text { int }) & =\mathbf{i n t} \\
\sigma\left(\tau \rightarrow \tau^{\prime}\right) & =\sigma(\tau) \rightarrow \sigma\left(\tau^{\prime}\right)
\end{aligned}
$$

We don't need to worry about avoiding variable capture: all type variables are "free."

Given two substitutions $\sigma_{1}$ and $\sigma_{2}$, we write $\sigma_{1} \circ \sigma_{2}$ for their composition: $\left(\sigma_{1} \circ \sigma_{2}\right)(\tau)=\sigma_{1}\left(\sigma_{2}(\tau)\right)$.

## Unification

Our constraints are of the form $\tau=\tau^{\prime}$.

## Unification

Our constraints are of the form $\tau=\tau^{\prime}$.
We say that a substitution $\sigma$ unifies constraint $\tau=\tau^{\prime}$ if
$\sigma(\tau)=\sigma\left(\tau^{\prime}\right)$.
We say that substitution $\sigma$ satisfies (or unifies) set of constraints $C$ if $\sigma$ unifies every constraint in $C$.

## Unification

If:

- $\Gamma \vdash e: \tau \mid C$, and
- $\sigma$ satisfies $C$, then e has type $\tau^{\prime}$ under $\Gamma$, where $\sigma(\tau)=\tau^{\prime}$.

If there are no substitutions that satisfy $C$, then $e$ is not typeable.

## Unification

If:

- $\Gamma \vdash e: \tau \mid C$, and
- $\sigma$ satisfies $C$,
then e has type $\tau^{\prime}$ under $\Gamma$, where $\sigma(\tau)=\tau^{\prime}$.

If there are no substitutions that satisfy $C$, then $e$ is not typeable.
So let's find a substitution $\sigma$ that unifies a set of constraints $C$ !

## Unification Algorithm

## Unification Algorithm

$\operatorname{unify}(\emptyset)=[] \quad$ (the empty substitution)

## Unification Algorithm

unify $(\emptyset)=[] \quad$ (the empty substitution)
$\operatorname{unify}\left(\left\{\tau=\tau^{\prime}\right\} \cup C^{\prime}\right)=$
if $\tau=\tau^{\prime}$ then
unify $\left(C^{\prime}\right)$

## Unification Algorithm

unify $(\emptyset)=[] \quad$ (the empty substitution)
$\operatorname{unify}\left(\left\{\tau=\tau^{\prime}\right\} \cup C^{\prime}\right)=$
if $\tau=\tau^{\prime}$ then
unify ( $C^{\prime}$ )
else if $\tau=X$ and $X$ not a free variable of $\tau^{\prime}$ then unify $\left(C^{\prime}\left\{\tau^{\prime} / X\right\}\right) \circ\left[X \mapsto \tau^{\prime}\right]$

## Unification Algorithm

unify $(\emptyset)=[] \quad$ (the empty substitution)
$\operatorname{unify}\left(\left\{\tau=\tau^{\prime}\right\} \cup C^{\prime}\right)=$
if $\tau=\tau^{\prime}$ then
unify ( $C^{\prime}$ )
else if $\tau=X$ and $X$ not a free variable of $\tau^{\prime}$ then unify $\left(C^{\prime}\left\{\tau^{\prime} / X\right\}\right) \circ\left[X \mapsto \tau^{\prime}\right]$
else if $\tau^{\prime}=X$ and $X$ not a free variable of $\tau$ then $\operatorname{unify}\left(C^{\prime}\{\tau / X\}\right) \circ[X \mapsto \tau]$

## Unification Algorithm

$\operatorname{unify}(\emptyset)=[] \quad$ (the empty substitution)
$\operatorname{unify}\left(\left\{\tau=\tau^{\prime}\right\} \cup C^{\prime}\right)=$
if $\tau=\tau^{\prime}$ then
unify ( $C^{\prime}$ )
else if $\tau=X$ and $X$ not a free variable of $\tau^{\prime}$ then unify $\left(C^{\prime}\left\{\tau^{\prime} / X\right\}\right) \circ\left[X \mapsto \tau^{\prime}\right]$
else if $\tau^{\prime}=X$ and $X$ not a free variable of $\tau$ then unify $\left(C^{\prime}\{\tau / X\}\right) \circ[X \mapsto \tau]$
else if $\tau=\tau_{o} \rightarrow \tau_{1}$ and $\tau^{\prime}=\tau_{o}^{\prime} \rightarrow \tau_{1}^{\prime}$ then $\operatorname{unify}\left(C^{\prime} \cup\left\{\tau_{0}=\tau_{0}^{\prime}, \tau_{1}=\tau_{1}^{\prime}\right\}\right)$

## Unification Algorithm

unify $(\emptyset)=[] \quad$ (the empty substitution)
$\operatorname{unify}\left(\left\{\tau=\tau^{\prime}\right\} \cup C^{\prime}\right)=$
if $\tau=\tau^{\prime}$ then
unify ( $C^{\prime}$ )
else if $\tau=X$ and $X$ not a free variable of $\tau^{\prime}$ then unify $\left(C^{\prime}\left\{\tau^{\prime} / X\right\}\right) \circ\left[X \mapsto \tau^{\prime}\right]$
else if $\tau^{\prime}=X$ and $X$ not a free variable of $\tau$ then unify $\left(C^{\prime}\{\tau / X\}\right) \circ[X \mapsto \tau]$
else if $\tau=\tau_{o} \rightarrow \tau_{1}$ and $\tau^{\prime}=\tau_{o}^{\prime} \rightarrow \tau_{1}^{\prime}$ then $\operatorname{unify}\left(C^{\prime} \cup\left\{\tau_{0}=\tau_{0}^{\prime}, \tau_{1}=\tau_{1}^{\prime}\right\}\right)$
else
fail

## Unification Properties

The unification algorithm always terminates.

## Unification Properties

The unification algorithm always terminates.
The solution, if it exists, is the most general solution: if $\sigma=$ unify $(C)$ and $\sigma^{\prime}$ is a solution to $C$, then there is some $\sigma^{\prime \prime}$ such that $\sigma^{\prime}=\left(\sigma^{\prime \prime} \circ \sigma\right)$.
