We derive recursive functions and look at execution of recursive calls. CS100J 03 October 2006 More on Recursion

Study Sect 15.1, p. 415. Watch activity 15-2.1 on the CD. In DrJava, write and test as many of the self-review exercises as you can (disregard those that deal with arrays).

My first job was working in an orange juice factory, but I got canned: couldn't concentrate.

Then I worked in the woods as a lumberjack, but I just couldn't hack it, so they gave me the axe.

After that I tried to be a tailor, but I just wasn't suited for it. Mainly because it was a so-so job.

Next I tried working in a muffler factory but that was exhausting.

I worked as a pilot but eventually got grounded for taking off too much.

Then I tried teaching but I couldn't make the grade.

# Problem with leading zeros: found by CS100J p216

Dec	Oct	Dec	Oct
0	0	14	16
1	1	15	17
2	2	16	20
3	3	17	21
4	4	18	22
5	5	19	23
6	6	20	24
7	7	21	25
8	10	22	26
9	11	23	27
10	12	24	30
11	13	25	31
12	14	26	32
13	15	27	33

In Java, a leading 0, as in 010 means the integer is intepreted as octal, so 010 represents the decimal 8. Also, 09 is illegal.

Java should never have made this choice, because is flies against mathematical convention and can cause confusion and hard-to-find bugs

Why will I get a Christmas card on Halloween?

### Recursive functions

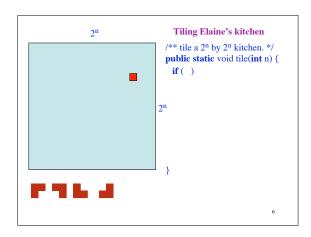

/\*\* = a copy of s in which s[0..1] are swapped, s[2..3] areswapped, s[3..4] are swapped, etc. \*/

public static String swapAdjacent(String s)

 $/** = b^{c}$ . Precondition:  $c \ge 0*/$ public static int exp(int b, int c)

```
Recursive functions
                                              number of calls
/** = b^c. Precondition: c \ge 0*/
public static int exp(int b, int c) {
                                        0
                                             1
  if (c = 0)
                                        1
                                             2
     return 1;
                                             2
                                        2
  if (c is odd)
                                             3
                                        4
     return b * exp(b, c-1);
                                        8
                                            4
  // c is even and > 0
                                        16 5
  return exp(b*b, c / 2);
                                        32 6
                                        2^n \quad n+1
32768 is 215
so b<sup>32768</sup> needs only 16 calls!
```

 $2^n$ Tiling Elaine's kitchen Elaine has a 2<sup>n</sup> by 2<sup>n</sup> kitchen. One square of it is covered by a 1 by 1 refrigerator. Tile the kitchen with these kinds of tiles:

# Executing recursive calls

# Steps in executing a call:

- Draw a frame for the call, including the parameters and local variables and scope box.
- 2. Assign argument values to the parameters.
- 3. Executed the method body.
- 4. Erase the frame —and give value of function call to caller.

method name: counter scope box

put parameters and local variables here

7

```
Executing recursive calls

/** = n!. Precondition: n ≥ 0 */
public static int fact(int n) {
    if (n <= 1)
        return 1;
    int b = fact(n-1);
    return n * b;
}

0! = 1.   n! = n * (n-1) * (n-2) * ... * 2 * 1

1.   Draw frame
2.   Assign arg values to pars
3.   Execute body
4.   Erase frame — and give value of function call back to caller.
```
