

## CS100J 27 February 2006 Casting About

1. Casting between classes
2. Apparent and real classes.
3. Operator **instanceof**
4. The class hierarchy
5. function equals

After today, you have learned ALL the basics of classes, and done extremely well. Be proud of yourselves.

### Procrastination

Leave nothing for to-morrow that can be done to-day. **Lincoln**

How does a project get a year behind schedule? One day at a time.

### Fred Brooks

I don't wait for moods. You accomplish nothing if you do that. Your mind must know it has got to get down to work. **Pearl S. Buck**

When I start a new project, I procrastinate immediately so that I have more time to catch up. **Gries**

Buy a poster with the procrastinator's creed here:

[http://www.art.com/asp/asp/\\_pd--10001845/Procrastinators\\_Creed.htm](http://www.art.com/asp/asp/_pd--10001845/Procrastinators_Creed.htm)

## Class Animal

```
public class Animal {
    private String name; // name of the animal
    private int age; // age of animal

    /** Constructor: an Animal with name n, age a */
    public Animal(String n, int a) { name = n; age = a; }

    /** = "this Animal is older than h" */
    public boolean isOlder(Animal h)
    { return this.age > h.age; }

    /** = the noise that the animal makes --
     * " in class Animal */
    public String getNoise () { return ""; }

    /** = the name of this Animal */
    public String getName() { return name; }

    /** = a description of this Animal */
    public String toString() { return "Animal " + name + ", age " + age; }
}
```

We put each method on one line to save space on the slide. Don't do it in your program.

2

## Class Cat

```
/** An instance is a cat */
public class Cat extends Animal {
    /** Constructor: a Cat with name n and age a */
    public Cat(String n, int a) { super(n, a); }

    /** = the noise this cat makes */
    public String getNoise() { return "meow"; }

    /** = a description of this Cat */
    public String toString() {
        return super.toString() + ", noise " + getNoise();
    }

    /** = weight of Cat */
    public int getWeight() { return 20; }
}
```

3

## Casting up the class hierarchy

You know about casts like

(int) (5.0 / 7.5)

(double) 6

double d= 5; // automatic cast

We now discuss casts up and down the class hierarchy.

Animal h= new Cat("N", 5);

Cat c= (Cat) h;

4

## Implicit casting up the class hierarchy

```
public class Animal {
    /** = "this is older than h" */
    public boolean isOlder(Animal h)
    { return this.age > h.age; }
}
```

```
c= new Cat("C", 5);
d= new Dog("D", 6);
c.isOlder(d) ?????
```

a1 is cast from Dog to Animal, automatically

Upward automatic casts make sense. Here, any Dog is an Animal

5

## Implicit casting up the class hierarchy

```
public class Animal {
    /** = "this is older than h" */
    public boolean isOlder(Animal h)
    { return this.age > h.age; }
}
```

```
c= new Cat("C", 5);
d= new Dog("D", 6);
```

c.isOlder(d) --what is its value?

Apparent type of h. Syntactic property. The type with which h is defined.

Two new terms to learn!

Real type of h: Doc (type of object a1).

Semantic property. The class-type of the folder whose name is currently in h.

Apparently, h is an Animal, but really, it's a Dog.

6

### What components can h reference?

```
public class Animal {
    /** = "this is older than h" */
    public boolean isOlder(Animal h) {
        return this.age > h.age;
    }
}
```

c= new Cat("C", 5);  
d= new Dog("D", 6);  
d.isOlder(c)

isOlder: 1      a1  
h      a0  
Animal

**Apparent type of h:** Animal  
**Real type of h:** Cat

**What can isOlder reference in object h?**

**Determined by the apparent type:**  
Only components in partition Animal (and above)!!!  
**h.getWeight() is illegal. Syntax error.**

7

### What method is called by h.toString() ?

```
public class Animal {
    public boolean isOlder(Animal h) {
        String s= h.toString();
        return this.age > h.age;
    }
}
```

c= new Cat("C", 5);  
d= new Dog("D", 6);  
d.isOlder(c)

isOlder: 1      a1  
h      a0      s

**Apparent type of h:** Animal  
**Real type of h:** Cat

**Determined by the real type:**  
The overriding toString() in Cat.

**What method is called by h.toString() ?**

8

### Explicit cast down the hierarchy

```
public class Animal {
    // If Animal is a cat, return its weight;
    // otherwise, return 0.
    public int checkWeight(Animal h) {
        if ( !(h instanceof Cat) )
            return 0;
        // h is a Cat
        int c= (Cat) h; // downward cast
        return c.getWeight();
    }
}
```

isOlder: 1      a1  
h      a0      c      a0  
Animal      Cat

**Apparent type of h:** Animal  
**Real type of h:** Cat

**Object**  
Animal  
Dog      Cat

Here, **(Dog) h** would lead to a runtime error.  
Don't try to cast an object to something that it is not!

9

### The correct way to write method equals

```
public class Animal {
    /** = "h is an Animal with the same
    values in its fields as this Animal" */
    public boolean equals (Object h) {
        if (!(h instanceof Animal)) return false;
        Animal ob= (Animal) h;
        return this.name.equals(ob.name) &&
            this.age == ob.age;
    }
}
```

**Object**  
Animal  
Dog      Cat

**Object**  
equals(Object)  
name      Animal  
age      Animal(String, int)  
isOlder(Animal)  
getNoise() getName()  
toString()  
Cat  
Cat(String, int)  
getNoise()  
toString() getWeight()
