

- Announcements:
 - Project 3 will be posted this weekend, due Thurs after break
 - Prelim 1 solutions:
 - Check it out if you made **minor** mistakes
 - **Don't read the solution** to a particular question if you had significant errors! Instead, try to re-do it and/or come to office hr to work with a staff member to really learn the material.

- Previous Lecture:
 - Easy plots in MATLAB
 - 1-d array of characters—string
- Today's Lecture:
 - 2-d array—matrix
- Reading:
 - CFile: Chapter 9 Sec 9.1, 9.2

2-d array: **matrix**

- An array is a **named** collection of **like** data organized into rows and columns
- A 2-d array is a table, called a **matrix**
- Two **indices** identify the position of a value in a matrix, e.g.,
`mat(r,c)`
 - refers to the cell in row **r**, column **c** of matrix **mat**
- Array index starts at **1**

September 29, 2005 Lecture 11 3

- ### Creating a matrix
- Built-in functions: **ones**, **zeros**, **rand**
 - E.g., `ones(2,3)` gives a 2-by-3 matrix of 1s
 - “Build” a matrix using square brackets, `[]`:
 - `[x y]` puts **y** to the right of **x**
 - `[x; y]` puts **y** below **x**
 - What are the dimensions of a matrix **M**?
 - `[nr, nc] = size(M)` % nr is #of rows, nc is #of columns
 - `nr = size(M, 1)` % # of rows
 - `nc = size(M, 2)` % # of columns
- September 29, 2005 Lecture 11 4

- ```
A= [1 1]
A= [A' ones(2,1)]
A= [1 1 1 1; A A]
```
- a. Error in 2<sup>nd</sup> statement
  - b. Error in 3<sup>rd</sup> statement
  - c. A is 3-by-4 matrix
  - d. A is 4-by-3 matrix
  - e. A is vector of length 12
- September 29, 2005      Lecture 11      6

### Example: min value in a matrix

```
function val = minInMatrix(M)
% val is the lowest value in matrix M
```

September 29, 2005      Lecture 11      7

## Pattern for traversing a matrix M

```
[nr, nc] = size(M)
for r= 1:nr
 for c= 1:nc

 % do something with M(r,c) ...

 end
end
```

September 29, 2005

Lecture 11

8

% Given an nr-by-nc matrix M

```
for r= 1: nr
 for c= 1: nc
 A(c,r)= M(r,c);
 end
end
```

- A is M with the columns in reverse order
- A is M with the rows in reverse order
- A is the transpose of M
- A and M are the same

September 29, 2005

Lecture 11

10

% Given an n-by-m matrix A

```
for g= 1: n
 for h= 1: floor(m/2)
 A(g,h)= A(g, m-h+1);
 end
end
```

- Reflect the right half of A onto the left half
- Reflect the bottom half of A onto the top half

Lecture 11

13

## Local minimum in a neighborhood

September 29, 2005

Lecture 11

15

## Local minimum in a neighborhood

September 29, 2005

Lecture 11

16

## Local minimum in a neighborhood

- Write a function `minInNeighborhood`
- Input parameters:
  - M: matrix of numeric values
  - loc: location of the middle of the neighborhood  
`loc(1)`, `loc(2)` are the row, column numbers
- Output parameter: `minVal`  
The minimum value of the neighborhood

September 29, 2005

Lecture 11

17

### Ask yourself leading questions!

- Can you find the min of a (sub)matrix?
  - Yes! Our function `minInMatrix(A)`
- Given the indices  $r, c$  (representing cell  $M(r,c)$ ), is it easy to define the neighborhood?
  - Yes, for the general case the neighborhood is  $M(r-1:r+1, c-1:c+1)$
  - But the "border cases" add complexity
- Can we get rid of the border cases?

September 29, 2005

Lecture 11

18

### Local minimum in a neighborhood

|   |    |    |     |              |              |              |
|---|----|----|-----|--------------|--------------|--------------|
|   | 2  | -1 | .5  | 0            | 1            |              |
|   | 3  | 8  | 6   | <del>7</del> | <del>7</del> |              |
| M | 5  | -3 | 8.5 | 9            | 10           | → Cell (3,5) |
|   | 52 | 81 | .5  | <del>7</del> | <del>2</del> |              |

Want to be able to use the **general case**,  
 $M(r-1:r+1, c-1:c+1)$
