

- Previous Lecture:
  - Intro to objects and classes
  - Creating objects and calling their methods
- Today's Lecture:
  - OO thinking
  - Defining a class:
    - Instance variables
    - Instance methods
    - Constructors
- Reading: Sec 4.1, 4.2

October 27, 2005      Lecture 18      2

### Multiple references can point to the same object

```
JFrame f1= new JFrame();
JFrame f3= f1;
f1.setTitle("X");
System.out.println(f3.getTitle());
```

f3==f1 gives

October 27, 2005      Lecture 18      17

### OO ideas

- Aggregate variables/methods into an abstraction (a **class**) that makes their relationship to one another explicit
- Objects (**instances of a class**) are self-governing (protect and manage themselves)
- Hide details from client, and restrict client's use of the services
- Allow clients to create/get as many objects as they want

October 27, 2005      Lecture 18      30

A server class  
class **Rect**

```
x [ ] u [ ]
y [ ] v [ ]
```

access

```
m1() ...
m2() ...
```

A client class

access

access

Data within objects should be protected: **private**  
Provide only a set of methods for **public** access.

October 27, 2005      Lecture 18      17

<pre>class Rect {     // attributes     private double left;     private double right;     ...     // drawRect method     ...     // area method     ...     // perimeter method     ... }</pre> <p style="text-align: center; color: green; font-weight: bold;">Server class</p>	<pre>public class UseRect {     public static void main     (String[] args) {         // create a rect         Rect r1 = new Rect(...);         // calculation on r1         r1.area()         // create another rect         Rect r2 = new Rect(...);         r2.drawRect()     } }</pre> <p style="text-align: center; color: green; font-weight: bold;">Client class</p>
---	---

October 27, 2005      Lecture 18      33

- We have used different classes already:
  - **System, Math**
  - **Keyboard, JFrame**
- Above classes provide various **services** (related services are grouped in same class)
- Implementation details of the class are hidden from the **client** (user)

October 27, 2005      Lecture 18      33

## Class Definition

```
public class class-name {
    declaration (and initialization)
    constructor
    methods
}
```

## Class definition: declarations

```
class Interval {
    private double base; // low end
    private double width; // interval width
}
```

- Declarations in a class define **fields (instance variables)** of the class
- Each class is a *type*. Classes are *not* primitive types.

## Declarations Revisited

- Syntax: *type name;*
- Examples: `int count;`  
`Interval in1;`  
`Interval in2;`
- Instance variables have default initial values
  - int variables: 0
  - Non-primitive (reference) variables: null
 Value null signifies that no object is referenced

## Object instantiation

- An expression of the form `new class-name()` computes a reference to a newly created object of the given class
- Examples:
 

```
Interval in1; //declaration
in1 = new Interval(); //instantiation
//Combined declaration & instantiation
Interval in2 = new Interval();
```

## Do not access fields directly

```
public class Client {
    public static void main(String[] args){
        Interval in1;
        in1= new Interval();
        System.out.println(
            in1.base+in1.width);
    }
}
```

## Class definition

```
class Interval {
    private double base; // low end
    private double width; // interval width

    /* =Get right end of interval */
    public double getEnd() {
        return base + width;
    }
}
```

## Instance method

```
public double getEnd() {
    return base + width;
}
```

The absence of the keyword `static` → an instance method  
(There isn't a keyword "instance")

## Methods

A method is a named, parameterized group of statements

```
modifier return-type method-name ( parameter-list ) {
    statement-list
}
```

return-type `void` means nothing is returned from the method

There must be a `return` statement, unless return-type is `void`

```
/* An Interval is [base, base+width] */
class Interval {
    private double base; // low end
    private double width; // interval width

    /* =Get right end of interval */
    public double getEnd() {
        return base + width;
    }
    /* set width to 4 */
    public void setWidth(double w) {
        width= w;
    }
}
```

## Calling an instance method

```
public class Client {
    public static void main(String[] args){

        Interval in1;
        in1= new Interval();
        double x;
        x= in1.getEnd();
        in1.setWidth(4);
    }
}
```

```
Interval in1= new Interval();
Interval in2= new Interval();
if ( in1.getEnd() > in2.getEnd() )
    System.out.println("blah...");
```

## Constructor

- A *constructor* is used to create objects
- Each class has a default constructor
- You can define your own constructor:
 

```
modifier class-name (parameter-list) {
    statements-list
}
```
- Use **public** as the modifier for now
- an instance method that has *no* return type

October 27, 2005

Lecture 18

64

```
class Interval {
    private double base; // low end
    private double width; // interval width

    /* An Interval with base b, width w */
    public Interval(double b, double w) {
        base= b;
        width= w;
    }

    public double getEnd() {
        return base + width;
    }
}
```

October 27, 2005

Lecture 18

65

```
class Interval {
    private double base; // low end
    private double width; // interval width

    /* Default constructor */
    public Interval() {}

    public double getEnd() {
        return base + width;
    }
}
```

October 27, 2005

Lecture 18

66

## Constructor invocation

```
new class-name ( expression-list )
```

- The value of above expression is a reference to a *new* object of the given *class-name*
- The defined (or default) constructor is invoked on the new object created by **new**

October 27, 2005

Lecture 18

67

## Creating an object

```
public class Client {
    public static void main(String[] args){

        Interval in1;
        in1= new Interval(
            0.5,1);

    }
}
```

October 27, 2005

Lecture 18

68

```
public Interval(double b, double w) {
    base= b;
    width= w;
}
```
