## CS1110 12 Mar 2009 Arrays. Reading: Secs 8.1, 8.2, 8.3

Listen to the following lectures on loops on your Plive CD. They are only

- 2-3 minutes long, and each has an insightful message.
- 1. The 3 lectures on Lesson page 7-6 read the whole page. 2. The 4 lectures in Lesson page 7-5.

## Computational simplicity

Most of us don't write perfect essays in one pass, and coding is the same: writing requires revising; programming requires revising.

If you are writing too much code —it gets longer and longer, with no end in sight: stop and look for a better way.

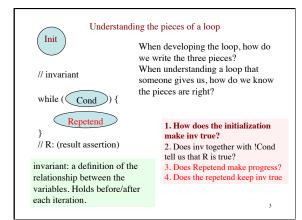

If your code is getting convoluted and you have trouble understanding it: stop and look for a better way.

Learn to keep things simple, to solve problems in simple ways. This sometimes requires a different way of thinking.

We are trying to teach not just Java but how to think about problem solving.

A key point is to break a problem up into several pieces and do each piece in isolation, without thinking about the rest of them. Our methodology for developing a loop does just that.

```
Zune error
/* day contains the number of days
                                   http://tinyurl.com/9b4hmy
  since ORIGINYEAR (1 Jan 1980)
                                      On 31 Dec 2008, the Zune
/* Set year to current year and day to
                                       stopped working. Anger!
  current day of current year */
year = ORIGINYEAR; /* = 1980 */
                                      On 1 Jan 2009 it worked.
                                           Zune clock code keeps
while (day > 365) {
 if (IsLeapYear(year)) {
                                            beginning of 1980. It
    if (day > 366) {
                                            calculates current day
       day= day - 366;
                                                and year from it.

Array: object. Can hold a fixed number of values of the same type. Array contains 4 int values.

The type of the array:

int[]

Variable contains name of the array.

Basic form of a declaration:

<type> <variable-name>;
A declaration of x.

Does not create array, it only declares x. x's initial value is null.

Elements of array are numbered: 0, 1, 2, ..., x.length-1;

Make everything as simple as possible, but no simpler. Einstein

Notes on array length

Array length: an instance field of the array.

This is why we write x.length, not x.length()

Length field is final: cannot be changed.

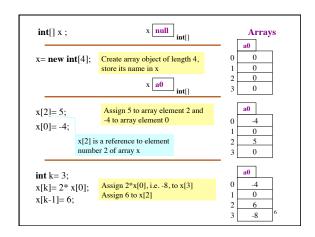

Length remains the same once the array has been created.

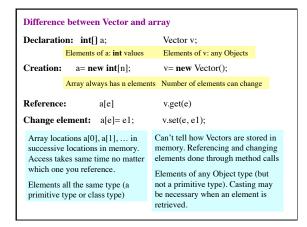

We omit it in the rest of the pictures.

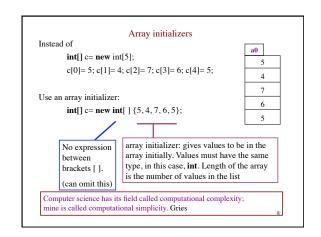

The length is not part of the array type.

The type is int[]

An array variable can be assigned arrays of different lengths.
