

Lecture 25

# **Designing Sequence Algorithms**

# Announcements for This Lecture

---

## Next Week

---

- There is no lab next week
  - But Tuesday hours are open
  - Open to **EVERYONE**
  - Go for help on lab or A7
- But lecture is **important**
  - Continue Today's topic
  - Setting us up for sorting
- Try to finish lab 12 first
  - Frees remaining time for A7

## Assignment 7

---

- Start working on it now!
  - Timeline is very important
  - Else too much stress at end
- **Goal:** Move aliens by Tues
  - Expected to be hardest part
  - Use lab next week
- Need an Extension?
  - Cannot put due date in finals
  - But you are allowed to *ask*

# Horizontal Notation for Sequences

---

Example of an assertion about an sequence  $b$ . It asserts that:

1.  $b[0..k-1]$  is sorted (i.e. its values are in ascending order)
  2. Everything in  $b[0..k-1]$  is  $\leq$  everything in  $b[k..\text{len}(b)-1]$
- 

Given index  $h$  of the **first element** of a segment and index  $k$  of the **element that follows** that segment, the number of values in the segment is  $k - h$ .

$b[h .. k - 1]$  has  $k - h$  elements in it.

$$(h+1) - h = 1$$

# Developing Algorithms on Sequences

---

- Specify the algorithm by giving its **precondition** and **postcondition** as pictures.
- Draw the **invariant** by drawing another picture that “generalizes” the **precondition** and **postcondition**
  - The invariant is true at the beginning and at the end
- The four loop design questions
  1. How does loop start (how to make the invariant true)?
  2. How does it stop (is the postcondition true)?
  3. How does the body make progress toward termination?
  4. How does the body keep the invariant true?

# Generalizing Pre- and Postconditions

- Dutch national flag: tri-color
  - Sequence of  $0..n-1$  of red, white, blue "pixels"
  - Arrange to put reds first, then whites, then blues

pre: b 

0	?	n
---	---	---

(values in  $0..n-1$  are unknown)

post: b 

0	n	
reds	whites	blues

inv: b 

0	j	k	l	n
reds	whites	?	blues	

Make the **red**, **white**, **blue** sections initially **empty**:

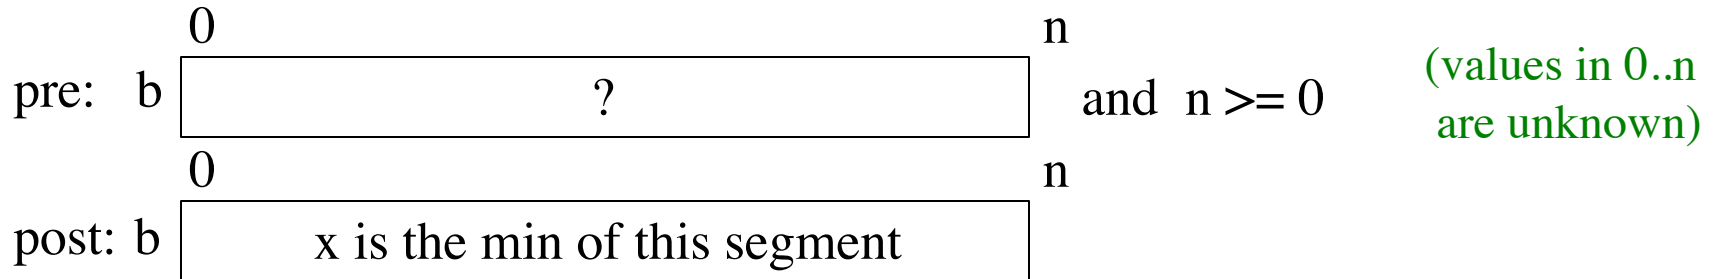

- Range  $i..i-1$  has 0 elements
- Main reason for this trick

Changing loop variables turns invariant into postcondition.

# Generalizing Pre- and Postconditions

---

- Finding the minimum of a sequence.

- 
- Put negative values before nonnegative ones.

# Generalizing Pre- and Postconditions

- Finding the minimum of a sequence.

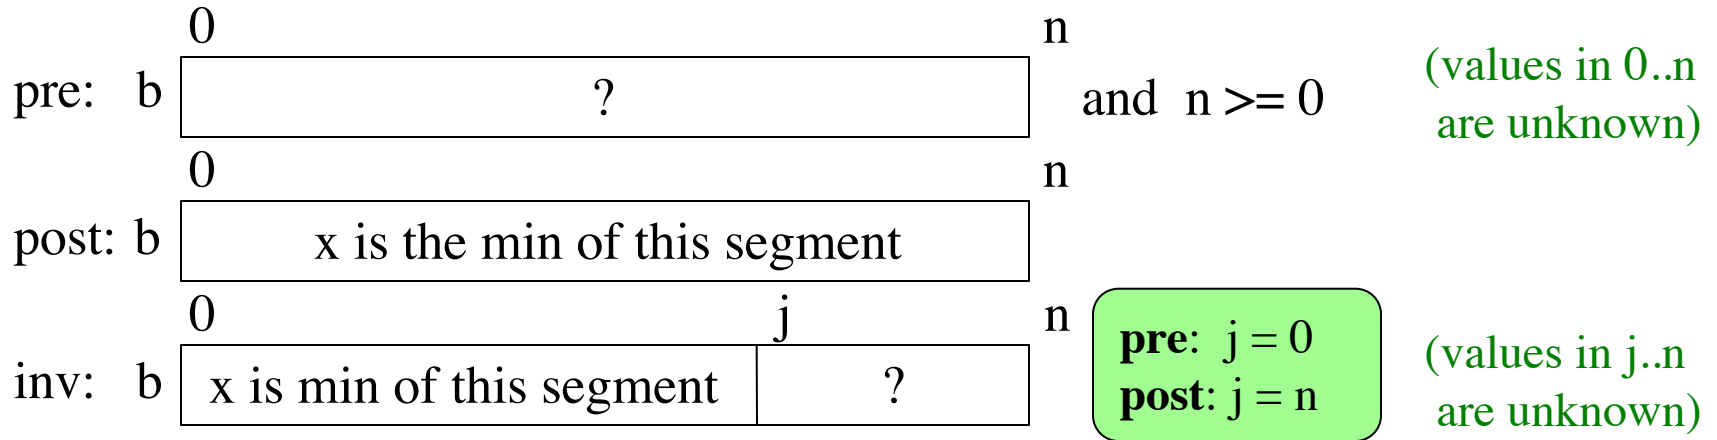

pre:	b	<table><tr><td>0</td><td>?</td><td>n</td></tr></table>	0	?	n	and $n \geq 0$	(values in 0..n are unknown)			
0	?	n								
post:	b	<table><tr><td>0</td><td>x is the min of this segment</td><td>n</td></tr></table>	0	x is the min of this segment	n					
0	x is the min of this segment	n								
inv:	b	<table><tr><td>0</td><td>j</td><td>n</td></tr><tr><td>x is min of this segment</td><td>?</td><td></td></tr></table>	0	j	n	x is min of this segment	?			(values in j..n are unknown)
0	j	n								
x is min of this segment	?									

- Put negative values before nonnegative ones.

pre: b	<table><tr><td>0</td><td>?</td><td>n</td></tr></table>	0	?	n	and $n \geq 0$	(values in 0..n are unknown)			
0	?	n							
post: b	<table><tr><td>0</td><td>k</td><td>n</td></tr><tr><td>&lt; 0</td><td>&gt;= 0</td><td></td></tr></table>	0	k	n	< 0	>= 0			
0	k	n							
< 0	>= 0								

# Generalizing Pre- and Postconditions

- Finding the minimum of a sequence.

- Put negative values before nonnegative ones.

# Generalizing Pre- and Postconditions

- Finding the minimum of a sequence.

pre:	b	<table><tr><td>0</td><td></td><td>n</td></tr><tr><td></td><td>?</td><td></td></tr></table>	0		n		?		and $n \geq 0$	(values in $0..n$ are unknown)				
0		n

Sequence Algorithms

10

# Partition Algorithm

- Given a sequence  $b[h..k]$  with some value  $x$  in  $b[h]$ :

- Swap elements of  $b[h..k]$  and store in  $j$  to truthify post:

- x** is called the **pivot value**
  - x** is not a program variable
  - denotes value initially in  $b[h]$

# Partition Algorithm

- Given a sequence  $b[h..k]$  with some value  $x$  in  $b[h]$ :

- Swap elements of  $b[h..k]$  and store in  $j$  to truthify post:

- $x$  is called the **pivot value**
  - $x$  is not a program variable
  - denotes value initially in  $b[h]$

# Partition Algorithm

---

- Given a sequence  $b[h..k]$  with some value  $x$  in  $b[h]$ :

- Swap elements of  $b[h..k]$  and store in  $j$  to truthify post:

# Partition Algorithm

- Given a sequence  $b[h..k]$  with some value  $x$  in  $b[h]$ :

- Swap elements of  $b[h..k]$  and store in  $j$  to truthify post:

- Agrees with precondition when  $i = h, j = k+1$
- Agrees with postcondition when  $j = i+1$

# Partition Algorithm Implementation

```
def partition(b, h, k):  
    """Partition list b[h..k] around a pivot x = b[h]"""  
    i = h; j = k+1; x = b[h]  
    # invariant: b[h..i-1] < x, b[i] = x, b[j..k] >= x  
    while i < j-1:  
        if b[i+1] >= x:  
            # Move to end of block.  
            _swap(b,i+1,j-1)  
            j = j - 1  
        else: # b[i+1] < x  
            _swap(b,i,i+1)  
            i = i + 1  
    # post: b[h..i-1] < x, b[i] is x, and b[i+1..k] >= x  
    return i
```

**partition(b,h,k), not partition(b[h:k+1])**  
Remember, slicing always copies the list!  
We want to partition the **original** list

# Partition Algorithm Implementation

```
def partition(b, h, k):
