

# Lecture 14: More Recursion!

CS 1110  
Introduction to Computing Using Python

[E. Andersen, A. Bracy, D. Gries, L. Lee, S. Marschner, C. Van Loan, W. White]

## Announcements

- Reminder: prelim 1 regrade requests due on Gradescope Wed 11:59pm  
*"When you review your prelim, if you believe a grading error was made, you may request a regrade on Gradescope until 11:59pm Wed Mar 23. We plan to handle all the regrade requests in one pass, after the regrade-request window has closed."*

3

## From previous lecture: Factorial

### Non-recursive definition:

$$n! = n \times n-1 \times \dots \times 2 \times 1$$

$$= n(n-1 \times \dots \times 2 \times 1)$$

### Recursive definition:

$$n! = n(n-1)! \quad \text{for } n > 0 \quad \text{Recursive case}$$

$$0! = 1 \quad \text{Base case}$$

5

- Slide 34 had a typo! Should be:  
for parent in p.parents:
- Slide 30 & 35 now has folders to better understand the Person class and its attributes

2

## Recursion

### Recursive Function:

A function that calls itself (directly or indirectly)

### Recursive Definition:

A definition that is defined in terms of itself

4

## Recursive Call Frames

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
    1 → if n == 0:
    2     return 1
    3     return n*factorial(n-1)
```

factorial(3)

6

## Recursive Call Frames

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
    1 if n == 0:
    2     return 1
    3     return n*factorial(n-1)
```

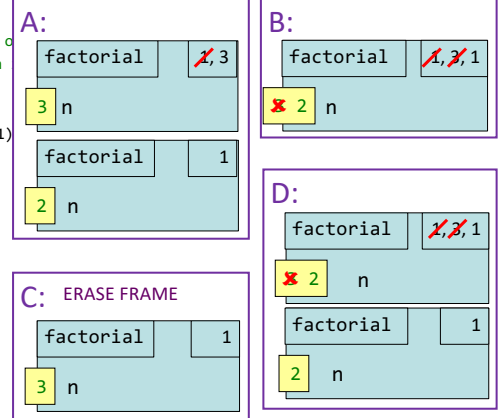

factorial(3)

Now what?  
Each call is a new frame!

## What happens next? (Q)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
    if n == 0:
    → return 1
    return n*factorial(n-1)
```

## Recursive Call Frames (n==2, execute line 1)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
    1 → if n == 0:
    2     return 1
    3     return n*factorial(n-1)
```

factorial(3)

## Recursive Call Frames (n==2, execute line 3)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
    1 if n == 0:
    2     return 1
    3 → return n*factorial(n-1)
```

factorial(3)

## Recursive Call Frames (n==1, execute line 1)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
    1 → if n == 0:
    2     return 1
    3     return n*factorial(n-1)
```

factorial(3)

## Recursive Call Frames (n==1, execute line 3)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
    1 if n == 0:
    2     return 1
    3 → return n*factorial(n-1)
```

factorial(3)

## Recursive Call Frames (n==0, execute line 1)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
1 → if n == 0:
2     return 1
3     return n*factorial(n-1)
```

factorial(3)

14

## Recursive Call Frames (n==0, execute line 2)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
1     if n == 0:
2 →     return 1
3     return n*factorial(n-1)
```

factorial(3)

15

## Recursive Call Frames (n==0, RETURN 1)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
1     if n == 0:
2 →     return 1
3     return n*factorial(n-1)
```

factorial(3)

16

## Recursive Call Frames (n==1, finish line 3)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
1     if n == 0:
2     return 1
3 →     return n*factorial(n-1)
```

factorial(3)

17

## Recursive Call Frames (n==1, RETURN 1)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
1     if n == 0:
2     return 1
3 →     return n*factorial(n-1)
```

factorial(3)

18

## Recursive Call Frames (n==2, finish line 3)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
1     if n == 0:
2     return 1
3 →     return n*factorial(n-1)
```

factorial(3)

19

## Recursive Call Frames (n==2, RETURN 6)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
    1 if n == 0:
    2     return 1
    3 return n*factorial(n-1)

factorial(3)
```

## Recursive Call Frames (n==3, finish line 3)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
    1 if n == 0:
    2     return 1
    3 return n*factorial(n-1)

factorial(3)
```

## Recursive Call Frames (n==3, RETURN 6)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
    1 if n == 0:
    2     return 1
    3 return n*factorial(n-1)

factorial(3)
```

## Recursive Call Frames (all calls complete!)

```
def factorial(n):
    """Returns: factorial of n.
    Precondition: n ≥ 0 an int"""
    1 if n == 0:
    2     return 1
    3 return n*factorial(n-1)

factorial(3)
```

## Divide and Conquer

**Goal:** Solve problem P on a piece of data

**Idea:** Split data into two parts and solve problem

Solve Problem P      Solve Problem P

Combine Answer!

## From Last Time: Divide and Conquer Example

Count the number of 'e's in a string:

Watch in the Python Tutor

0 1 0 1 0 1 0 0

## Example: Palindromes

- **Example:**

AMANAPLANACANALPANAMA

MOM

A

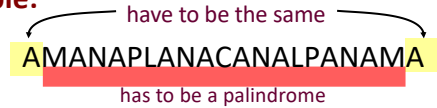

- Dictionary definition: “a word that reads (spells) the same backward as forward”
- Can we define recursively?

26

## Example: Palindromes

- Strings with  $\leq 1$  character are palindromes
- String with  $\geq 2$  characters is a palindrome if:
  - its first and last characters are equal, and
  - the rest of the characters form a palindrome

- **Example:**

- **Implement:**

```
def ispalindrome(s):
    """Returns: True if s is a palindrome"""
```

## Example: Palindromes (1)

Strings with  $\leq 1$  character are palindromes

String with  $\geq 2$  characters is a palindrome if:

- its first and last characters are equal, and
- the rest of the characters form a palindrome

*Recursive Definition!*

What is the simple case? What is the complex case?

```
def ispalindrome(s):
    """Returns: True if s is a palindrome"""
    if len(s) < 2:
        return True
    endsAreSame = _____
    middleIsPali = _____
    return _____
```

28

## Example: Palindromes (2)

Strings with  $\leq 1$  character are palindromes

String with  $\geq 2$  characters is a palindrome if:

- its first and last characters are equal, and
- the rest of the characters form a palindrome

*Recursive Definition!*

What is the simple case? What is the complex case?

```
def ispalindrome(s):
    """Returns: True if s is a palindrome"""
    if len(s) < 2:
        return True
    endsAreSame = s[0] == s[-1]
    middleIsPali = ispalindrome(s[1:-1])
    return endsAreSame and middleIsPali
```

29

## Recursion and Objects

- Class Person, 3 attributes

- name: String
- parent1: Person (or None)
- parent2: Person (or None)

- Represents the “family tree”

- Goes as far back as known
- Attributes parent1 and parent2 are None if not known

- **Constructor:** Person(name, p1, p2)

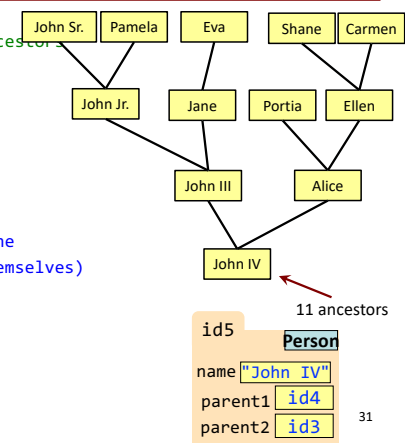

30

## Recursion and Objects: Setup

```
def count_ancestors(p):
    """Returns: num of known ancestors
    Pre: p is a Person"""
    # 1. Handle base case.
    # No parents (no ancestors)

    # 2. Break into two parts
    # Has parent1 or parent2
    # Count ancestors of each one
    # (plus parent1, parent2 themselves)

    # 3. Combine the result
```

31

## Recursion and Objects: Implementation

```
def count_ancestors(p):
    """Returns: num of known ancestors
    Pre: p is a Person"""
    # 1. Handle base case.
    # No parents (no ancestors)
    if p.parent1 == None and p.parent2 == None:
        return 0
    # 2. Break into two parts
    # Has parent1 or parent2
    # Count ancestors of each one
    # (plus parent1, parent2 themselves)
    parent1s_fam = 0
    if p.parent1 != None:
        parent1s_fam = 1 + count_ancestors(p.parent1)
    parent2s_fam = 0
    if p.parent2 != None:
        parent2s_fam = 1 + count_ancestors(p.parent2)
    # 3. Combine the result
    return parent1s_fam + parent2s_fam
```

32

## Recursion and Objects: Finishing Touches

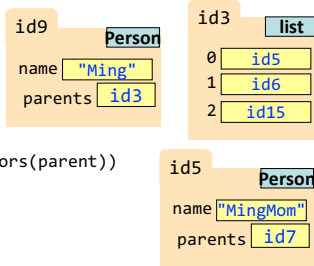

```
def count_ancestors(p):
    """Returns: num of known ancestors
    Pre: p is a Person"""
    # 1. Handle base case.
    # No parents (no ancestors)
    if p.parent1 == None and p.parent2 == None:
        return 0
    # 2. Break into two parts
    # Has parent1 or parent2
    # Count ancestors of each one
    # (plus parent1, parent2 themselves)
    parent1s_fam = 0
    if p.parent1 != None:
        parent1s_fam = 1 + count_ancestors(p.parent1)
    parent2s_fam = 0
    if p.parent2 != None:
        parent2s_fam = 1 + count_ancestors(p.parent2)
    # 3. Combine the result
    return parent1s_fam + parent2s_fam
```

We don't actually need this. It is handled by the conditionals in #2.

33

## "It Takes a Village" Version: Lots of Parents

```
def count_ancestors(p):
    """Returns: num of known ancestors
    Pre: p is a Person with attribute parents, a list of parents """
    # 1. Handle base case. (We decided this wasn't necessary)
    # 2. Break into parts
    # For each parent, count ancestors
    # (plus parent, parent2 themselves)
    n_ancestors = 0
    for parent in p.parents:
        n_ancestors += (1 + count_ancestors(parent))
    # 3. Combine the result : FREE!
    return n_ancestors
```

34

## Exercise: Find Ancestors

```
def list_ancestors(p):
```

```
    """Returns: list of all ancestors of p"""
    # 1. Handle base case.
    # 2. Break into parts.
    # 3. Combine answer.
```

Optional practice question. Try it after you complete this week's lab exercise.

35
