## def sum(thelist): """Returns: the sum of all elements in thelist Precondition: thelist is a list of all numbers (either floats or ints)""" result = 0 result = result + thelist[0] result = result + thelist[1] ... There is a problem here

## **Working with Sequences**

- Sequences are potentially unbounded
  - Number of elements inside them is not fixed
  - Functions must handle sequences of different lengths
  - **Example**: sum([1,2,3]) vs. sum([4,5,6,7,8,9,10])
- Cannot process with **fixed** number of lines
  - Each line of code can handle at most one element
  - What if # of elements > # of lines of code?
- We need a new control structure

1

The For-Loop # Create local var x # Write as a for-loop x = seqn[0]for x in seqn: print(x) print(x) x = seqn[1]**Key Concepts** print(x) Not valid Python · iterable: segn x = seqn[len(seqn)-1]• loop variable: x print(x) body: print(x)

4

3

def despace(s):

"""Returns: s but with its spaces removed
Precondition: s is a string"""

result = "

for x in s:

if x != ":

result = result + x

Body

return result

5 6

## Modifying the Contents of a List def add\_one(thelist): """(Procedure) Adds 1 to every element in the list Precondition: thelist is a list of all numbers (either floats or ints)""" for x in thelist: | x = x+1 | # procedure; no return

7

Never modify loop var!
Need a second sequence
How about the *positions*?
for x in thelist:
 thelist.append(1)
Try in Python Tutor
 to see what happens
Need a second sequence
How about the *positions*?
thelist = [5, 2, 7, 1]
 thepos = [0, 1, 2, 3]

This is the Motivation for Iterables

Iterables are objects
Contain data like a list
But cannot slice them
Have list-like properties
Can use then in a for-loop
Can convert them to lists
mylist = list(myiterable)

Example: Files
Use open() to create object
Makes iterable for reading

10

9

## The Range Iterator Very versatile tool • range(x) · Great for processing ints Creates an iterator ■ Stores [0,1,...,x-1] Accumulator total = 0But not a list! But try list(range(x)) # add the squares of ints # in range 2..200 to total • range(a,b) Stores [a,...,b-1] for x in range(2,201): • range(a,b,n) total = total + x\*x■ Stores [a,a+n,...,b-1]

Modifying the Contents of a List

def add\_one(thelist):

"""(Procedure) Adds 1 to every element in the list
Precondition: thelist is a list of all numbers
(either floats or ints)"""

size = len(thelist)
for k in range(size):

thelist[k] = thelist[k]+1
# procedure; no return

WORKS!
