

### A Mathematical Example: Factorial

- Non-recursive definition:  

$$n! = n \times n-1 \times \dots \times 2 \times 1$$

$$= n (n-1 \times \dots \times 2 \times 1)$$
- Recursive definition:  

$$n! = n (n-1)! \quad \text{for } n \geq 0 \quad \text{Recursive case}$$

$$0! = 1 \quad \text{Base case}$$

What happens if there is no base case?

1

### Factorial as a Recursive Function

```
def factorial(n):
    """Returns: factorial of n.
    Pre: n ≥ 0 an int"""
    if n == 0:
        return 1
    return n*factorial(n-1)
```

- $n! = n (n-1)!$
- $0! = 1$

Base case(s)

Recursive case

What happens if there is no base case?

2

### Example: Fibonacci Sequence

- Sequence of numbers: 1, 1, 2, 3, 5, 8, 13, ...  
 $a_0 \ a_1 \ a_2 \ a_3 \ a_4 \ a_5 \ a_6$ 
  - Get the next number by adding previous two
  - What is  $a_8$ ?
- Recursive definition:
  - $a_n = a_{n-1} + a_{n-2}$  **Recursive Case**
  - $a_0 = 1$  **Base Case**
  - $a_1 = 1$  **(another) Base Case**

Why did we need two base cases this time?

3

### Fibonacci as a Recursive Function

```
def fibonacci(n):
    """Returns: Fibonacci no.  $a_n$ 
    Precondition: n ≥ 0 an int"""
    if n <= 1:
        return 1
    return (fibonacci(n-1)+
            fibonacci(n-2))
```

- Function that calls itself
  - Each call is new frame
  - Frames require memory
  - $\infty$  calls =  $\infty$  memory

4

### Fibonacci: # of Frames vs. # of Calls

- Fibonacci is very inefficient.
  - $\text{fib}(n)$  has a stack that is always  $\leq n$
  - But  $\text{fib}(n)$  makes a lot of **redundant calls**

5

### Recursion is best for Divide and Conquer

**Goal:** Solve problem P on a piece of data

data

**Idea:** Split data into two parts and solve problem

data 1

data 2

Solve Problem P

Solve Problem P

Combine Answer!

6

### Divide and Conquer Example

Count the number of 'e's in a string:

7

### Three Steps for Divide and Conquer

1. **Decide what to do on “small” data**
  - Some data cannot be broken up
  - Have to compute this answer directly
2. **Decide how to break up your data**
  - Both “halves” should be smaller than whole
  - Often no wrong way to do this (next lecture)
3. **Decide how to combine your answers**
  - Assume the smaller answers are correct
  - Combining them should give bigger answer

8

### Divide and Conquer Example

```
def num_es(s):
    """Returns: # of 'e's in s"""
    # 1. Handle small data
    if s == "":
        return 0
    elif len(s) == 1:
        return 1 if s[0] == 'e' else 0

    # 2. Break into two parts
    left = num_es(s[0])
    right = num_es(s[1:])

    # 3. Combine the result
    return left+right
```

“Short-cut” for  
 if s[0] == 'e':  
     return 1  
 else:  
     return 0

9

### Exercise: Remove Blanks from a String

```
def deblank(s):
    """Returns: s w/o blanks"""
    if s == "":
        return s
    elif len(s) == 1:
        return " if s[0] == '' else s

    left = deblank(s[0])
    right = deblank(s[1:])

    return left+right
```

Handle small data

Break up the data

Combine answers

10

### Minor Optimization

```
def deblank(s):
    """Returns: s w/o blanks"""
    if s == "":
        return s

    left = s[0]
    if s[0] == ' ':
        left = "
    right = deblank(s[1:])

    return left+right
```

Less recursive calls

Eliminate the  
second base  
by combining

11

### Following the Recursion

12
