

## Example: Reversing a String

```
def reverse(s):
    """Returns: reverse of s
    Precondition: s a string"""
    # 1. Handle small data
    if len(s) <= 1:
        return s
    # 2. Break into two parts
    left = s[0]
    right = reverse(s[1:])
    # 3. Combine the result
    return right+left
```

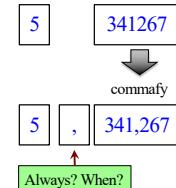

1

## How to Break Up a Recursive Function?

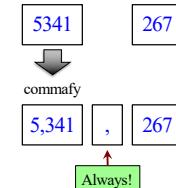

```
def commafy(s):
    """Returns: string with commas every 3 digits
    e.g. commafy('5341267') = '5,341,267'
    Precondition: s represents a non-negative int"""

```

### Approach 1

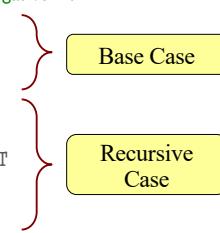

### Approach 2

2

## How to Break Up a Recursive Function?

```
def commafy(s):
    """Returns: string with commas every 3 digits
    e.g. commafy('5341267') = '5,341,267'
    Precondition: s represents a non-negative int"""
    # 1. Handle small data.
    if len(s) <= 3:
        return s
    # 2. Break into two parts
    left = commafy(s[:-3])
    right = s[-3:] # Small part on RIGHT
    # 3. Combine the result
    return left + ',' + right
```

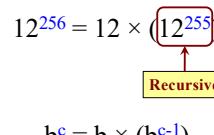

3

## How to Break Up a Recursive Function?

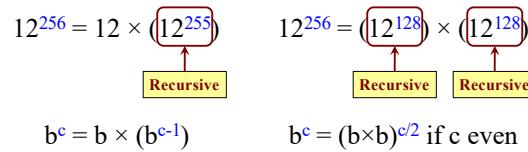

```
def exp(b, c):
    """Returns: b^c
    Precondition: b a float, c ≥ 0 an int"""

```

### Approach 1

### Approach 2

$b^c = b \times (b^{c-1})$  if  $c$  even

4

## Raising a Number to an Exponent

```
def exp(b, c):
    """Returns: b^c
    Precond: b a float, c ≥ 0 an int"""
    # b^0 is 1
    if c == 0:
        return 1
    # c > 0
    if c % 2 == 0:
        return exp(b*b,c//2)
    return b*exp(b*b,(c-1)//2)
```

c	# of calls
0	0
1	1
2	2
4	3
8	4
16	5
32	6
$2^n$	$n + 1$

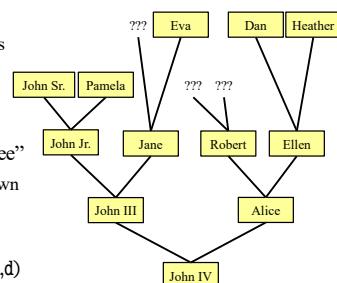

$32768$  is 215  
 $b^{32768}$  needs only 215 calls!

5

## Recursion and Objects

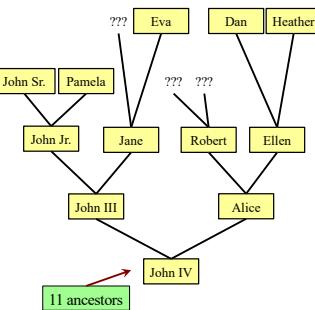

- Class Person (person.py)
  - Objects have 3 attributes
  - **name**: String
  - **mom**: Person (or None)
  - **dad**: Person (or None)
- Represents the “family tree”
  - Goes as far back as known
  - Attributes mom and dad are None if not known
- **Constructor**: Person(n,m,d)
  - Or Person(n) if no mom, dad

6

## Recursion and Objects

```
def num_ancestors(p):
    """Returns: num of known ancestors
    Pre: p is a Person"""
    # 1. Handle small data.
    if p.mom == None and p.dad == None:
        return 0
    # 2. Break into two parts
    moms = 0
    if not p.mom == None:
        moms = 1+num_ancestors(p.mom)
    dads = 0
    if not p.dad == None:
        dads = 1+num_ancestors(p.dad)
    # 3. Combine the result
    return moms+dads
```

7

## Example: Palindromes

- String with  $\geq 2$  characters is a palindrome if:
  - its first and last characters are equal, and
  - the rest of the characters form a palindrome

### • Example:

have to be the same  
**AMANAPLANACANALPANAMA**  
 has to be a palindrome

### • Function to Implement:

```
def ispalindrome(s):
    """Returns: True if s is a palindrome""""
```

8

## Example: Palindromes

- String with  $\geq 2$  characters is a palindrome if:
  - its first and last characters are equal, and
  - the rest of the characters form a palindrome

```
def ispalindrome(s):
    """Returns: True if s is a palindrome"""
    if len(s) < 2:
        return True
```

Recursive Definition

Base case

```
# Halves not the same; not divide and conquer
ends = s[0] == s[-1]
middle = ispalindrome(s[1:-1])
return ends and middle
```

Recursive case

## Recursive Functions and Helpers

```
def ispalindrome2(s):
    """Returns: True if s is a palindrome
    Case of characters is ignored"""
    if len(s) < 2:
        return True
    # Halves not the same; not divide and conquer
    ends = equals_ignore_case(s[0], s[-1])
    middle = ispalindrome2(s[1:-1])
    return ends and middle
```

Use helper functions!

- Pull out anything not part of the recursion
- Keeps your code simple and easy to follow

```
def equals_ignore_case(a, b):
    """Returns: True if a and b are same ignoring case"""
    return a.upper() == b.upper()
```

10

## Example: More Palindromes

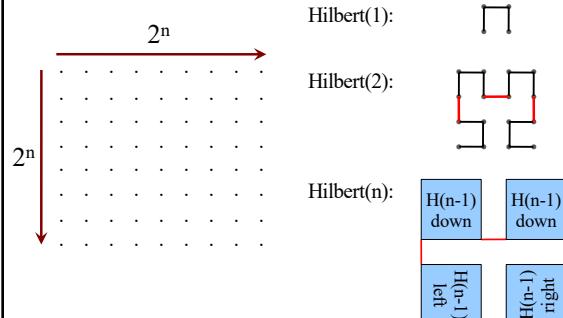

```
def ispalindrome3(s):
    """Returns: True if s is a palindrome
    Case of characters and non-letters ignored"""
    return ispalindrome2(depunct(s))
```

```
def depunct(s):
    """Returns: s with non-letters removed"""
    if s == '':
        return s
    # Combine left and right
    if s[0] in string.letters:
        return s[0]+depunct(s[1:])
    # Ignore left if it is not a letter
    return depunct(s[1:])
```

Use helper functions!

- Sometimes the helper is a recursive function
- Allows you break up problem in smaller parts
