

- Previous Lecture:
 - Branching (`if`, `elseif`, `else`, `end`)
 - Relational operators (`<`, `>`, `==`, `~=`, `...`, etc.)
- Today's Lecture:
 - Logical operators (`&&`, `||`, `~`), "short-circuiting"
 - More branching—*nesting*
 - Top-down design
- Announcements:
 - Project 1 (P1) due Thursday at 11pm
 - Observe the rules on academic integrity
 - Submit `.m` files (plain text, not from a word processing software such as Microsoft Word)
 - Register your clicker with CIT. Use the link on course website.
 - Discussion this week in Upson B7 computer lab, not classrooms listed on roster

Consider the quadratic function

$$q(x) = x^2 + bx + c$$

on the interval $[L, R]$:

■ Is the function strictly increasing in $[L, R]$?

■ Which is **smaller**, $q(L)$ or $q(R)$?

■ What is the **minimum value** of $q(x)$ in $[L, R]$?

September 7, 2010

Lecture 4

3

Modified Problem 3

Write a code fragment that prints "yes" if x_c is in the interval and "no" if it is not.

September 7, 2010

Lecture 4

4

$$q(x) = x^2 + bx + c$$

$$x_c = -b/2$$

September 7, 2010

Lecture 4

5

So what is the requirement?

```
% Determine whether xc is in
% [L,R]
xc = -b/2;

if _____

    disp('Yes')
else
    disp('No')
end
```

September 7, 2010

Lecture 4

8

The value of a boolean expression is either true or false.

$$(L \leq xc) \ \&\& \ (xc \leq R)$$

This (compound) boolean expression is made up of two (simple) boolean expressions. Each has a value that is **either** **true** or **false**.

Connect boolean expressions by **boolean** operators:

and	or	not
<code>&&</code>	<code> </code>	<code>~</code>

September 7, 2010

Lecture 4

10

Logical operators

&& logical and: Are both conditions true?

E.g., we ask “is $L \leq x_c$ **and** $x_c \leq R$?”

In our code: `L <= xc && xc <= R`

|| logical or: Is at least one condition true?

E.g., we can ask if x_c is outside of $[L, R]$,

i.e., “is $x_c < L$ **or** $R < x_c$?”

In code: `xc < L || R < xc`

~ logical not: Negation

E.g., we can ask if x_c is **not outside** $[L, R]$.

In code: `~(xc < L || R < xc)`

Lecture 4

14

“Truth table”

X, Y represent boolean expressions.
E.g., $d > 3.14$

X	Y	X && Y “and”	X Y “or”	~Y “not”
F	F			
F	T			
T	F			
T	T			

September 7, 2010

Lecture 4

21

Logical operators “short-circuit”

`a > b && c > d`
true 

`a > b && c > d`
false 

Entire expression is false since
the first part is false

A **&&** condition short-circuits to false if the left operand evaluates to **false**.

A **||** condition short-circuits to _____ if _____

September 7, 2010

Lecture 4

24

Always use logical operators to connect simple boolean expressions

Why is it wrong to use the expression

`L <= xc <= R`

for checking if x_c is in $[L, R]$?

Example: Suppose L is 5, R is 8, and xc is 10. We know that 10 is not in $[5, 8]$, but the expression

`L <= xc <= R` gives...

September 7, 2010

Lecture 4

26

Variables a , b , and c have whole number values. **True** or **false**: This fragment prints “Yes” if there is a *right triangle* with side lengths a , b , and c and prints “No” otherwise.

```
if a^2 + b^2 == c^2
    disp('Yes')
else
    disp('No')
end
```

A: true

B: false

Lecture 4

27

Consider the quadratic function

$$q(x) = x^2 + bx + c$$

on the interval $[L, R]$:

■ Is the function strictly increasing in $[L, R]$?

■ Which is **smaller**, $q(L)$ or $q(R)$?

■ What is the **minimum value** of $q(x)$ in $[L, R]$?

September 7, 2010

Lecture 4

30

Start with pseudocode

If x_c is between L and R

Min is at x_c

Otherwise

Min is at one of the endpoints

We have *decomposed* the problem into three pieces! Can choose to work with any piece next: the if-else construct/condition, min at x_c , or min at an endpoint

Set up structure first: if-else, condition

```
if L<=xc && xc<=R
```

Then min is at x_c

```
else
```

Min is at one of the endpoints

```
end
```

Now *refine* our solution-in-progress. I'll choose to work on the if-branch next

Refinement: filled in detail for task "min at x_c "

```
if L<=xc && xc<=R
```

```
% min is at xc
```

```
qMin= xc^2 + b*xc + c;
```

```
else
```

Min is at one of the endpoints

```
end
```

Continue with refining the solution... else-branch next

Refinement: detail for task "min at an endpoint"

```
if L<=xc && xc<=R
```

```
% min is at xc
```

```
qMin= xc^2 + b*xc + c;
```

```
else
```

```
% min is at one of the endpoints
```

```
if % xc left of bracket
```

```
% min is at L
```

```
else % xc right of bracket
```

```
% min is at R
```

```
end
```

```
end
```

Continue with the refinement, i.e., replace comments with code

Final solution (given b,c,L,R,xc)

```
if L<=xc && xc<=R
```

```
% min is at xc
```

```
qMin= xc^2 + b*xc + c;
```

```
else
```

```
% min is at one of the endpoints
```

```
if xc < L
```

```
qMin= L^2 + b*L + c;
```

```
else
```

```
qMin= R^2 + b*R + c;
```

```
end
```

```
end
```

An if-statement can appear within a branch—just like any other kind of statement!

Lecture 4

41

Notice that there are 3 alternatives → can use elseif!

```
if L<=xc && xc<=R
    % min is at xc
    qMin= xc^2+b*xc+c;
else
    % min at one endpt
    if xc < L
        qMin= L^2+b*L+c;
    else
        qMin= R^2+b*R+c;
    end
end
```

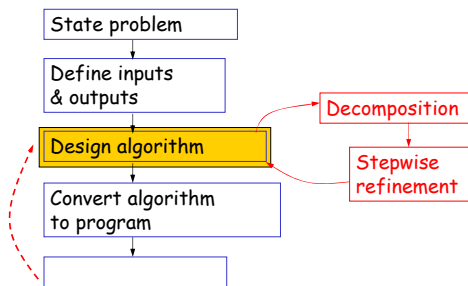

```
if L<=xc && xc<=R
    % min is at xc
    qMin= xc^2+b*xc+c;
elseif xc < L
    qMin= L^2+b*L+c;
else
    qMin= R^2+b*R+c;
end
```

September 7, 2010

Lecture 4

42

Top-Down Design

An algorithm is an *idea*. To use an algorithm you must choose a programming language and *implement* the algorithm.

Question

A stick of unit length is split into two pieces. The breakpoint is randomly selected. On average, how long is the shorter piece?

A: .000001

B: .25

C: .333333

D: .499999

E: none of the above
