  - Characters and strings
- Announcement:
  - Project 4 due Mon 10/26 at 11pm

Characters & strings

- We have used strings already:
  - `n= input('Next number: ')`
  - `sprintf('Answer is %d', ans)`
- A string is made up of individual characters, so a string is a 1-d array of characters
- '`CS1112 rocks!`' is a character array of length 13; it has 7 letters, 4 digits, 1 space, and 1 symbol.

'C'	'S'	'1'	'1'	'1'	'2'	' '	'r'	'o'	'c'	'k'	's'	'!'

- Can have 2-d array of characters as well

'C'	'S'	'1'	'1'	'1'	'2'
'r'	'o'	'c'	'k'	's'	'!'

2×6 matrix

Matlab types: `char`, `double`, `uint8`, `logical`

There is not a type "string"! What we call a "string" is a 1-d array of chars

`a`	`a` is a 1-d array with type `char` components. We call `a` a "string" or "char array"
`b = [3 9]`	`b` is a 1-d array with type `double` components. `double` is the default type for numbers in Matlab. We call `b` a "numeric array"
`c = uint8(b)`	`c` is a 1-d array with type `uint8` components. We call `c` a "uint8 array"
`d = rand > .5`	`d` is a scalar of the type `logical`. We call `d` a "boolean value"

Strings are important in computation

Numerical data is often encoded in strings. E.g., a file containing Ithaca weather data begins with the string

`W07629N4226`

meaning

Longitude: 76° 29' West
Latitude: 42° 26' North

We may need to grab hold of the substring `W07629`, convert `076` and `29` to the numeric values 76 and 29, and do some computation

Comparison of genomic sequences is another example of string computation

- E.g., looking for a pattern:
  Given the sequence `ATTCTGACCTCGATC...`
  Look for the pattern `ACCT`
- E.g., quantifying the difference between sequences:

`ATTCTGACCTCGATC`
`ATTCGTGACCTCGAT`

What if this nucleotide is removed?

Single quotes enclose strings in Matlab

Anything enclosed in single quotes is a string (*even if it looks like something else*)

- `'100'` is a character array (string) of length 3
- `100` is a numeric value
- `'pi'` is a character array of length 2
- `pi` is the built-in constant 3.1416…
- `'x'` is a character (vector of length 1)
- `x` may be a variable name in your program

Strings are vectors

Vectors

- Assignment
  v= [7 0 5];
- Indexing
  x= v(3); % x is 5
  v(1)= 1; % v is [1 0 5]
  w= v(2:3); % w is [0 5]
- : notation
  v= 2:5; % v is [2 3 4 5]
- Appending
  v= [7 0 5];
  v(4)= 2; % v is [7 0 5 2]
- Concatenation
  v= [v [4 6]];
  % v is [7 0 5 2 4 6]

Strings

- Assignment
  s= 'hello';
- Indexing
  c= s(2); % c is 'e'
  s(1)= 'J'; % s is 'Jello'
  t= s(2:4); % t is 'ell'
- : notation
  s= 'a':'g'; % s is 'abcdefg'
- Appending
  s= 'duck';
  s(5)= 's'; % s is 'ducks'
- Concatenation
  s= [s ' quack'];
  % s is 'ducks quack'

Some useful string functions

```
str= 'Cs 1112';

length(str)   % 7
isletter(str) % [1 1 0 0 0 0 0]
isspace(str)  % [0 0 1 0 0 0 0]
lower(str)    % 'cs 1112'
upper(str)    % 'CS 1112'

ischar(str)
  % Is str a char array? True (1)
strcmp(str(1:2),'cs')
  % Compare strings str(1:2) & 'cs'. False (0)
strcmp(str(1:3),'CS')
  % False (0)
```

Example: capitalize 1st letter

Write a function to capitalize the first letter of each word in a string. Assume that the string has lower case letters and blanks only. (OK to use built-in function **upper**)

```
function [str, nCaps] = caps(str)
% Post: Capitalize first letter of each word.
%    str = partially capitalized string
%    nCaps = no. of capital letters
% Pre: str = string with lower case letters & blanks only
```

look for the spaces

Look For The Spaces

See `caps.m`

The ASCII Table

Char	Dec	Oct	Hex	Char	Dec	Oct	Hex	Char	Dec	Oct	Hex	Char	Dec	Oct	Hex

Character vs ASCII code

```
str= 'Age 19'
    %a 1-d array of characters
code= double(str)
    %convert chars to ascii values
str1= char(code)
    %convert ascii values to chars
```

Arithmetic and relational ops on characters

- `'c'-'a'` gives 2
- `'6'-'5'` gives 1
- `letter1='e'; letter2='f';`
- `letter1-letter2` gives -1

- `'c'>'a'` gives true
- `letter1==letter2` gives false

- `'A' + 2` gives 67
- `char('A'+2)` gives 'C'

What is in variable g (if it gets created)?

```
d1= 'Mar 3';  d2= 'Mar 9';
x1= d1(5);  x2= d2(5);
g= x2-x1;
```

- A: the character '6'
- B: the numeric value 6
- C: Error in assigning variables x1, x2
- D:Error in the subtraction operation
- E: Some other value or error

What is in variable g (if it gets created)?

```
d1= 'Mar 13';  d2= 'Mar 29';
x1= d1(5:6);  x2= d2(5:6);
g= x2-x1;
```

- A: the string '16'
- B: the numeric value 16
- C: Error in assigning variables x1, x2
- D:Error in the subtraction operation
- E: Some other value or error

Example: toUpper

Write a function toUpper(cha) to convert character cha to upper case if cha is a lower case letter. Return the converted letter. If cha is not a lower case letter, simply return the character cha.

Hint: Think about the distance between a letter and the base letter 'a' (or 'A'). E.g.,

a b c d e f g h …

distance = 'g'-'a' = 6 = 'G'-'A'

A B C D E F G H …

Of course, do not use Matlab function upper!

```
function up = toUpper(cha)
% up is the upper case of character cha.
% If cha is not a letter then up is just cha.

up= cha;

cha is lower case if it is between 'a' and 'z'
```

Example: removing all occurrences of a character

- From a genome bank we get a sequence
  ATTG CCG TA GCTA CGTACGC AACTGG AAATGGC CGTAT…
- First step is to "clean it up" by removing all the blanks. Write this function:

```
function s = removeChar(c, s)
% Return string s with all occurrences
% of character c removed
```

Example: removing all occurrences of a character

Can solve this problem using iteration—check one character (one component of the vector) at a time

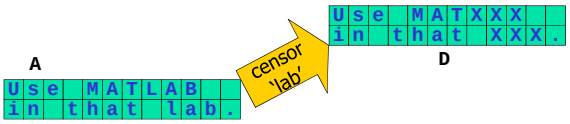
```
function s = removeChar_loop(c, s)
% Return string s with all occurrences of
% character c removed.

t= '';
for k= 1:length(s)

end
s= t;
```

Example: censoring words

```
function D = censor(str, A)
% Replace all occurrences of string str in
% character matrix A with X's, regardless of
% case.
% Assume str is never split across two lines.
% D is A with X's replacing str.
```



Lecture 18 52

```
function D = censor(str, A)
% Replace all occurrences of string str in character matrix A,
% regardless of case, with X's.
% A is a matrix of characters.
% str is a string.  Assume that str is never split across two lines.
% D is A with X's replacing the censored string str.

D= A;
B= lower(A);
s= lower(str);
ns= length(str);
[nr,nc]= size(A);

% Build a string of X's of the right length

% Traverse the matrix to censor string str
```

Lecture 17 53

```
function D = censor(str, A)
% Replace all occurrences of string str in character matrix A,
% regardless of case, with X's.
% A is a matrix of characters.
% str is a string.  Assume that str is never split across two lines.
% D is A with X's replacing the censored string str.

D= A;
B= lower(A);
s= lower(str);
ns= length(str);
[nr,nc]= size(A);

% Build a string of X's of the right length
Xs= char( zeros(1,ns));
for k= 1:ns
    Xs(k)= 'X';
end

% Traverse the matrix to censor string str
for r= 1:nr
    for c= 1:nc-ns+1
        if  strcmp( s , B(r, c:c+ns-1) )==1
            D(r, c:c+ns-1)= Xs;
        end
    end
end
```

Xs: [redacted]

B:

1	2	3							10
u	s	e		m	a	t	l	a	b
i	n		t	h	a	t		l	a	b	.

Returns an array of type **double**

Changes the type to **char**

Lecture 17 54
