

- Previous Lecture:
  - Examples on vectors and simulation
- Today's Lecture:
  - Finite vs. Infinite; Discrete vs. Continuous
  - Vectors and vectorized code
  - Color computation with *linear interpolation*
- Announcements:
  - Project 3 due Monday at 11pm
  - Prelim I on Thursday 10/13 at 7:30pm. You must notify us now if you have an exam conflict. Email Randy Hess (rbh27) with your conflict information (course number, instructor contact info).

# Loop patterns for working with a vector

```
% Given a vector v  
  
for k = 1:length(v)  
  
    % Work with v(k)  
    % E.g., disp(v(k))  
  
end
```

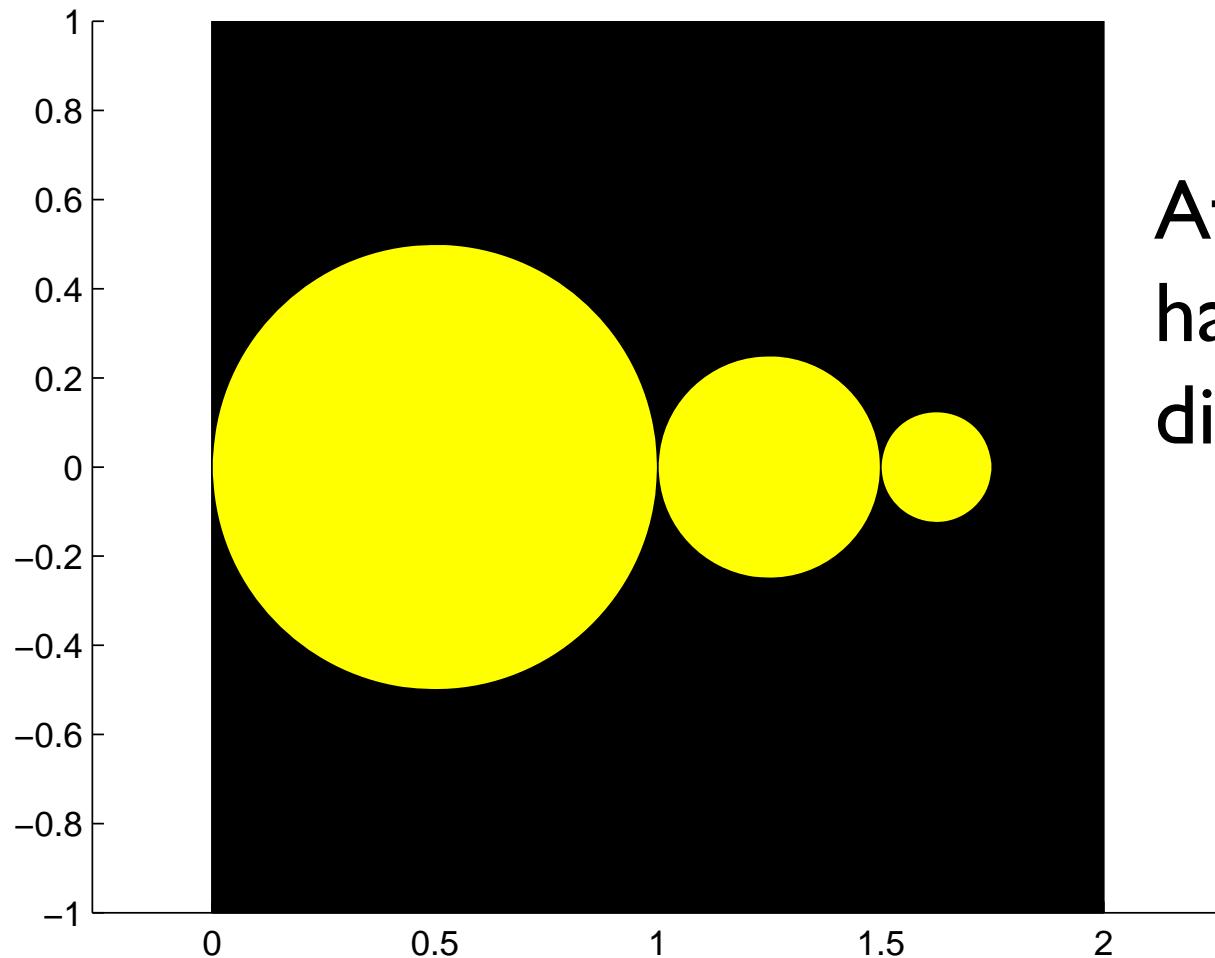

```
% Given a vector v  
k = 1;  
while k<=length(v)  
  
    % Work with v(k)  
    % E.g., disp(v(k))  
  
    k = k+1;  
  
end
```

# Discrete vs. continuous

A plot is made from discrete values, but it can look continuous if there're many points

# Screen Granularity

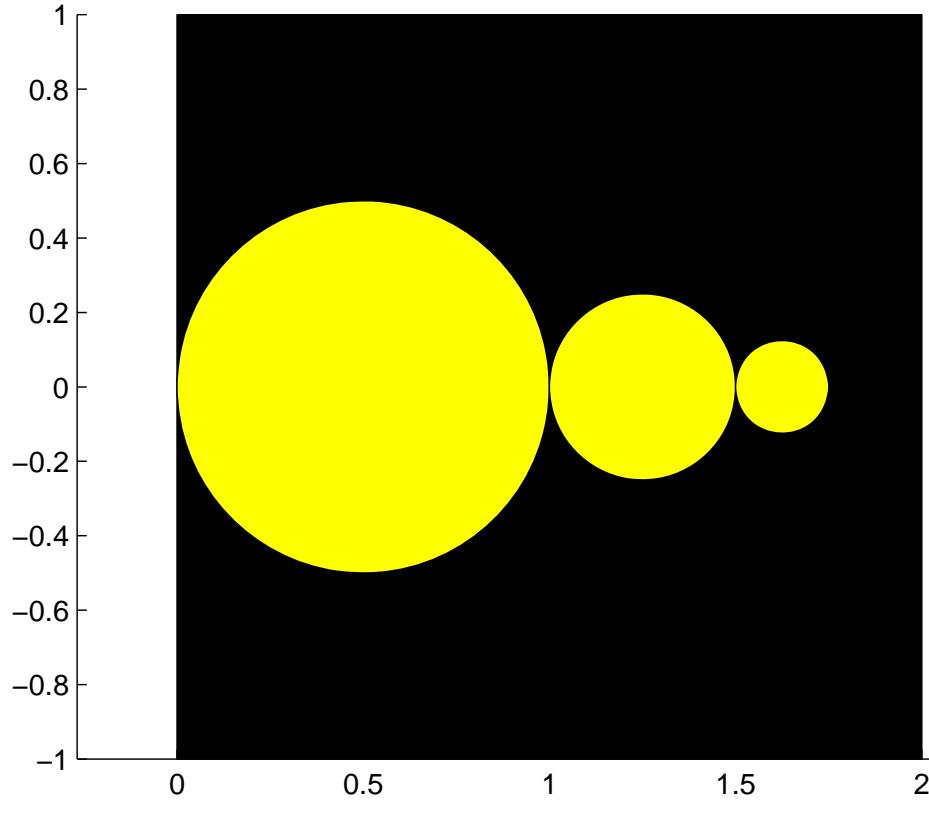

After how many  
halvings will the  
disks disappear?

## Xeno's Paradox

- A wall is two feet away
- Take steps that repeatedly halve the remaining distance
- You never reach the wall because the distance traveled after  $n$  steps =

$$1 + \frac{1}{2} + \frac{1}{4} + \dots + \frac{1}{2^n} = 2 - \frac{1}{2^n}$$

## Example: “Xeno” disks

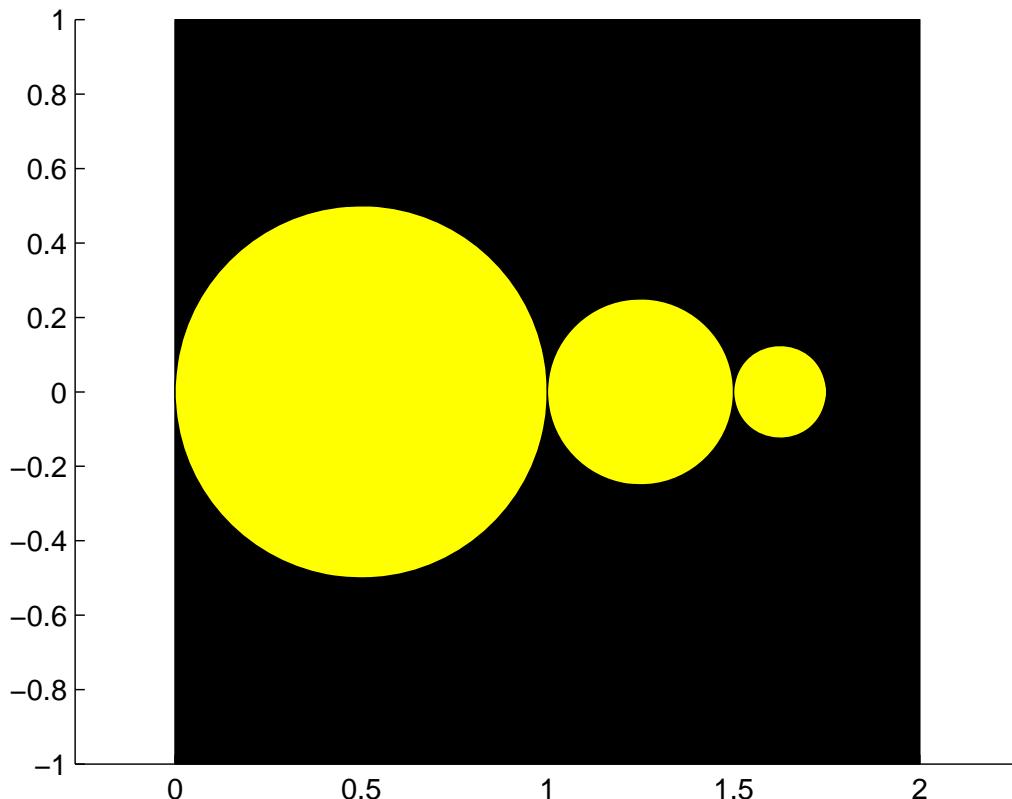

Draw a sequence of 20 disks where the  $(k+1)$ th disk has a diameter that is half that of the  $k$ th disk.

The disks are tangent to each other and have centers on the x-axis.

First disk has diameter 1 and center  $(1/2, 0)$ .

## Example: “Xeno” disks

What do you need to keep track of?

- Diameter ( $d$ )
- Position  
Left tangent point ( $x$ )

Disk	$x$	$d$
1	0	1
2	$0+1$	$1/2$
3	$0+1+1/2$	$1/4$

% Xeno Disks

**DrawRect(0,-1,2,2,'k')**

% Draw 20 Xeno disks

```
% Xeno Disks
```

```
DrawRect(0,-1,2,2,'k')
```

```
% Draw 20 Xeno disks
```

```
for k= 1:20
```

```
end
```

```
% Xeno Disks
```

```
DrawRect(0,-1,2,2,'k')
```

```
% Draw 20 Xeno disks
```

```
d= 1;
```

```
x= 0; % Left tangent point
```

```
for k= 1:20
```

```
end
```

```
% Xeno Disks
```

```
DrawRect(0,-1,2,2,'k')
```

```
% Draw 20 Xeno disks
```

```
d= 1;
```

```
x= 0; % Left tangent point
```

```
for k= 1:20
```

```
    % Draw kth disk
```

```
    % Update x, d for next disk
```

```
end
```

```
% Xeno Disks
```

```
DrawRect(0,-1,2,2,'k')  
% Draw 20 Xeno disks  
d= 1;  
x= 0; % Left tangent point  
for k= 1:20  
    % Draw kth disk  
    DrawDisk(x+d/2, 0, d/2, 'y')  
    % Update x, d for next disk  
    x= x+d;  
    d= d/2;  
  
end
```

# Here's the output... Shouldn't there be 20 disks?

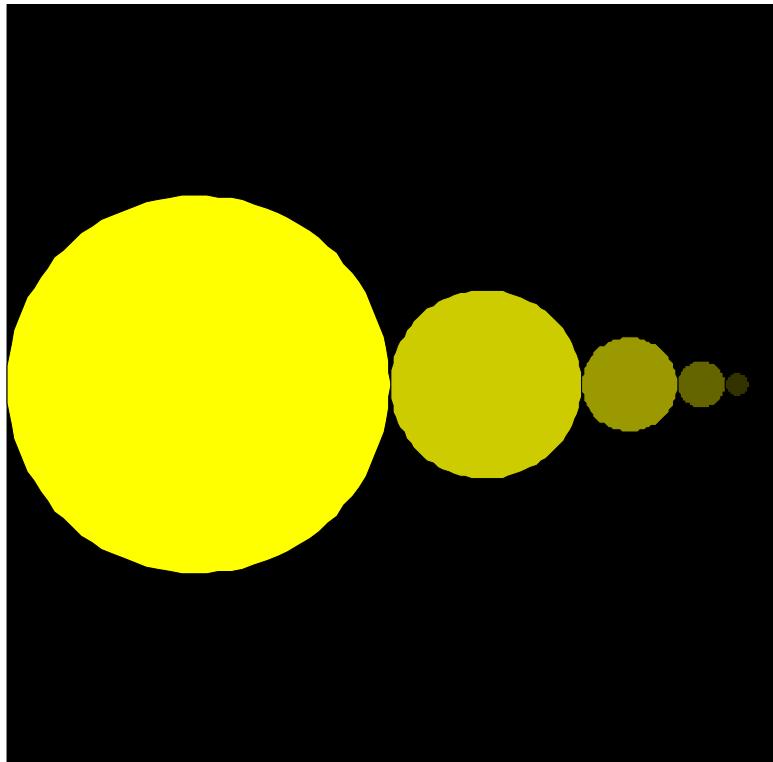

The “screen” is an array of dots called pixels.

Disks smaller than the dots don't show up.

The 20<sup>th</sup> disk has radius <.000001

# Fading Xeno disks

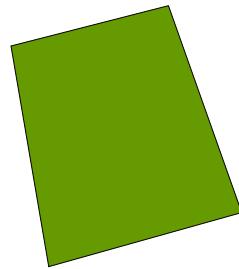

- First disk is **yellow**
- Last disk is **black**  
(invisible)
- Interpolate the color in between

## Color is a 3-vector, sometimes called the **RGB** values

- Any color is a mix of **red**, **green**, and **blue**
- Example:

```
colr= [ 0.4   0.6   0 ]
```

- Each component is a real value in  $[0,1]$
- $[0 0 0]$  is black
- $[1 1 1]$  is white

```
% Draw n Xeno disks  
d= 1;  
x= 0; % Left tangent point  
  
for k= 1:n  
  
    % Draw kth disk  
    DrawDisk(x+d/2, 0, d/2, 'y')  
    x= x+d;  
    d= d/2;  
end
```

```

% Draw n Xeno disks

d= 1;

x= 0; % Left tangent point

for k= 1:n

    % Draw kth disk
    DrawDisk(x+d/2, 0, d/2, [1 1 0])

    x= x+d;
    d= d/2;

end

```

A vector of length 3

```

% Draw n fading Xeno disks

d= 1;

x= 0; % Left tangent point

yellow= [1 1 0];
black= [0 0 0];

for k= 1:n

    % Compute color of kth disk

    % Draw kth disk

    DrawDisk(x+d/2, 0, d/2, _____)

    x= x+d;

    d= d/2;

end

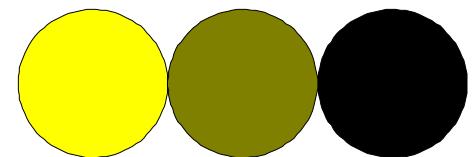

```

## Example: 3 disks fading from yellow to black

```
r= 1; % radius of disk
yellow= [1 1 0];
black = [0 0 0];

% Left disk yellow, at x=1
DrawDisk(1,0,r,yellow)
% Right disk black, at x=5
DrawDisk(5,0,r,black)

% Middle disk with average color, at x=3
colr= 0.5*yellow + 0.5*black;
DrawDisk(3,0,r,colr)
```

## Example: 3 disks fading from yellow to black

```
r= 1; % radius of disk
```

```
yellow= [1 1 0];
```

```
black = [0 0 0];
```

$$.5 \times \begin{bmatrix} 1 & 1 & 0 \end{bmatrix} \rightarrow \begin{bmatrix} .5 & .5 & 0 \end{bmatrix}$$

$$.5 \times \begin{bmatrix} 0 & 0 & 0 \end{bmatrix} \rightarrow \begin{bmatrix} 0 & 0 & 0 \end{bmatrix}$$

```
% Left disk yellow, at x=1
```

Vectorized  
multiplication

```
DrawDisk(1,0,r,yellow)
```

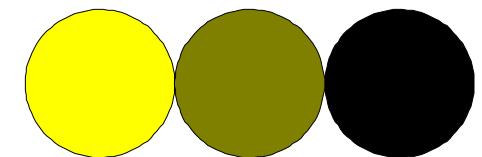

```
% Right disk black, at x=5
```

```
DrawDisk(5,0,r,black)
```

```
% Middle disk with average color, at x=3
```

```
colr= 0.5*yellow + 0.5*black;
```

```
DrawDisk(3,0,r,colr)
```

## Example: 3 disks fading from yellow to black

```
r= 1; % radius of disk  
yellow= [1 1 0];  
black = [0 0 0];  
  
% Left disk yellow, at x=1  
DrawDisk(1,0,r,yellow)  
% Right disk black, at x=5  
DrawDisk(5,0,r,black)  
  
% Middle disk with average color, at x=3  
colr= 0.5*yellow + 0.5*black;  
DrawDisk(3,0,r,colr)
```

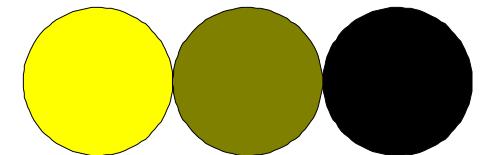

Vectorized  
addition +

$$\begin{array}{|c|c|c|} \hline .5 & .5 & 0 \\ \hline \end{array}$$

$$\begin{array}{|c|c|c|} \hline 0 & 0 & 0 \\ \hline \end{array}$$

---

$$= \begin{array}{|c|c|c|} \hline .5 & .5 & 0 \\ \hline \end{array}$$

Vectorized code allows an operation on multiple values at the same time

```
yellow= [1 1 0];  
black = [0 0 0];
```

Vectorized  
addition

$$\begin{array}{r} \begin{array}{|c|c|c|} \hline .5 & .5 & 0 \\ \hline \end{array} \\ + \\ \begin{array}{|c|c|c|} \hline 0 & 0 & 0 \\ \hline \end{array} \\ \hline \end{array} = \begin{array}{|c|c|c|} \hline .5 & .5 & 0 \\ \hline \end{array}$$

```
% Average color via vectorized op
```

```
colr= 0.5*yellow + 0.5*black;
```

Operation performed on vectors

```
% Average color via scalar op
```

```
for k = 1:length(black)
```

```
    colr(k)= 0.5*yellow(k) + 0.5*black(k);
```

```
end
```

Operation performed on scalars

```

% Draw n fading Xeno disks

d= 1;

x= 0; % Left tangent point

yellow= [1 1 0];
black= [0 0 0];

for k= 1:n

    % Compute color of kth disk

    % Draw kth disk

    DrawDisk(x+d/2, 0, d/2, _____)

    x= x+d;

    d= d/2;

end

```

```

% Draw n fading Xeno disks

d= 1;

x= 0; % Left tangent point

yellow= [1 1 0];

black= [0 0 0];

for k= 1:n
    % Compute color of kth disk
    colr= ____*black + ____*yellow;

    % Draw kth disk
    DrawDisk(x+d/2, 0, d/2, colr)

    x= x+d;
    d= d/2;
end

```

Use linear interpolation to obtain the colors. Each disk has a color that is a linear combination of yellow and black. Let  $f$  be a fraction in  $(0,1)$  ...

$f = ???$

`color= f*black + (1-f)*yellow;`

# Linear interpolation

Code to draw one  
row of Xeno disks  
at some y-coordinate

```
end
```

Be careful with initializations

```

yellow=[1 1 0]; black=[0 0 0];

d= 1;

x= 0;

for k= 1:n
    % Compute color of kth disk
    f= (k-1)/(n-1);
    colr= f*black + (1-f)*yellow;
    % Draw kth disk
    DrawDisk(x+d/2, 0, d/2, colr)
    x=x+d; d=d/2;
end

```

Where to put the loop header `for y=__:_:_`

A →

```
yellow=[1 1 0]; black=[0 0 0];
```

B →

```
d= 1;
```

C →

```
x= 0;
```

D →

```
for k= 1:n
```

% Compute color of kth disk

```
f= (k-1)/(n-1);
```

```
colr= f*black + (1-f)*yellow;
```

% Draw kth disk

```
DrawDisk(x+d/2, 0, d/2, colr)
```

```
x=x+d; d=d/2;
```

```
end
```

end

y

```

yellow=[1 1 0]; black=[0 0 0];
for y= __:_:__
    d= 1;
    x= 0;
    % initializations necessary for each row
    for k= 1:n
        % Compute color of kth disk
        f= (k-1)/(n-1);
        colr= f*black + (1-f)*yellow;
        % Draw kth disk
        DrawDisk(x+d/2, 0, d/2, colr)
        x=x+d; d=d/2;
    end
end

```

initializations necessary for each row

y

# Does this script print anything?

```
k = 0;  
while 1 + 1/2^k > 1  
    k = k+1;  
end  
disp(k)
```

## Computer Arithmetic—floating point arithmetic

Suppose you have a calculator with a window like this:

representing  $2.41 \times 10^{-3}$

# Floating point addition

+	2	4	1	-	3
---	---	---	---	---	---

+	1	0	0	-	3
---	---	---	---	---	---

Result:

+	3	4	1	-	3
---	---	---	---	---	---

# Floating point addition

+	2	4	1	-	3
---	---	---	---	---	---

+	1	0	0	-	4
---	---	---	---	---	---

Result:

+	2	5	1	-	3
---	---	---	---	---	---

# Floating point addition

+	2	4	1	-	3
---	---	---	---	---	---

+	1	0	0	-	5
---	---	---	---	---	---

Result:

+	2	4	2	-	3
---	---	---	---	---	---

# Floating point addition

+	2	4	1	-	3
---	---	---	---	---	---

+	1	0	0	-	6
---	---	---	---	---	---

Result:

+	2	4	1	-	3
---	---	---	---	---	---

Not enough room to  
represent .002411

The loop DOES terminate given the limitations of floating point arithmetic!

```
k = 0;  
while 1 + 1/2^k > 1  
    k = k+1;  
end  
disp(k)
```

$1 + 1/2^{53}$  is calculated to be just 1,  
so "53" is printed.
