- Previous Lecture:
  - Examples on vectors and simulation
- Today's Lecture:
  - Finite vs. Infinite; Discrete vs. Continuous
  - Vectors and vectorized code
  - Color computation with *linear interpolation*
- Announcements:
  - Project 3 due Monday at 11pm
  - Prelim 1 on Thursday 10/13 at 7:30pm. You must notify us now if you have an exam conflict. Email Randy Hess (rbh27) with your conflict information (course number, instructor contact info).

Loop patterns for working with a vector

```
% Given a vector v

for k = 1:length(v)

  % Work with v(k)
  % E.g., disp(v(k))

end
```

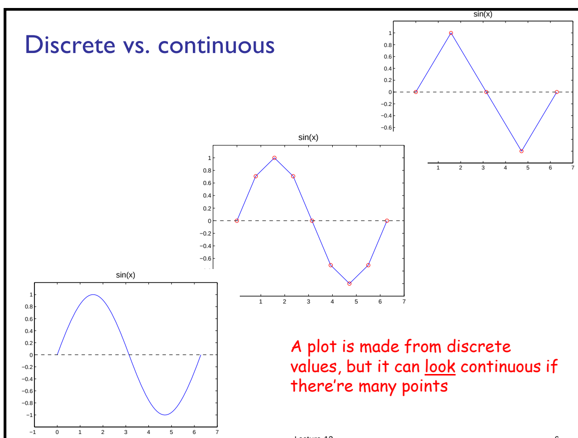
```
% Given a vector v
k = 1;
while k<=length(v)

  % Work with v(k)
  % E.g., disp(v(k))

  k = k+1;

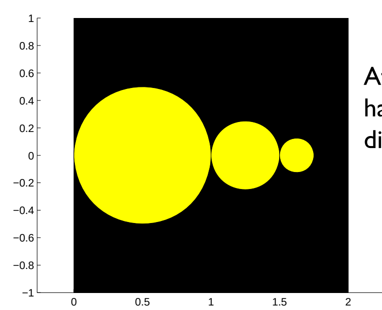
end
```

Discrete vs. continuous



A plot is made from discrete values, but it can look continuous if there're many points

Screen Granularity



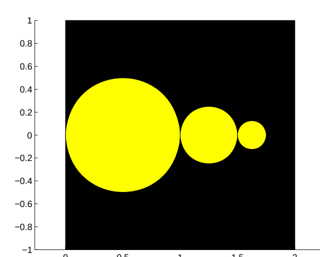
After how many halvings will the disks disappear?

Xeno's Paradox

- A wall is two feet away
- Take steps that repeatedly halve the remaining distance
- You never reach the wall because the distance traveled after n steps =

$$1 + \frac{1}{2} + \frac{1}{4} + \ldots + 1/2^n = 2 - 1/2^n$$

Example: "Xeno" disks

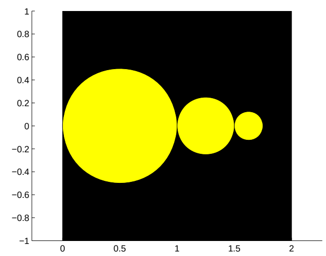


Draw a sequence of 20 disks where the (k+1)th disk has a diameter that is half that of the kth disk.

The disks are tangent to each other and have centers on the x-axis.

First disk has diameter 1 and center (1/2, 0).

Example: "Xeno" disks



What do you need to keep track of?

- Diameter (d)
- Position
  Left tangent point (x)

Disk	x	d
1	0	1
2	0+1	1/2
3	0+1+1/2	1/4

```
% Xeno Disks

DrawRect(0,-1,2,2,'k')
% Draw 20 Xeno disks

for k= 1:20

end
```

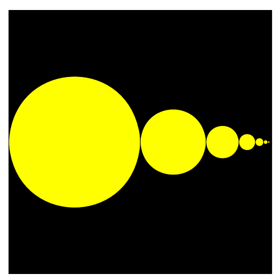
```
% Xeno Disks

DrawRect(0,-1,2,2,'k')
% Draw 20 Xeno disks
d= 1;
x= 0;  % Left tangent point
for k= 1:20
   % Draw kth disk

   % Update x, d for next disk

end
```

Here's the output… Shouldn't there be 20 disks?

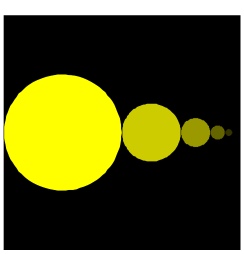


The "screen" is an array of dots called pixels.

Disks smaller than the dots don't show up.

The 20th disk has radius<.000001

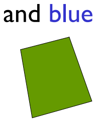
Fading Xeno disks



- First disk is yellow
- Last disk is black (invisible)
- *Interpolate* the color in between

Color is a 3-vector, sometimes called the RGB values

- Any color is a mix of red, green, and blue
- Example:
  `colr= [0.4  0.6  0]`



- Each component is a real value in [0,1]
- [0 0 0] is black
- [1 1 1] is white

```
% Draw n fading Xeno disks
d= 1;
x= 0;  % Left tangent point
yellow= [1 1 0];
black=  [0 0 0];
for k= 1:n
   % Compute color of kth disk

   % Draw kth disk
   DrawDisk(x+d/2, 0, d/2, _______)
   x= x+d;
   d= d/2;
end
```

Example: 3 disks fading from yellow to black

```
r= 1;  % radius of  disk
yellow= [1 1 0];
black = [0 0 0];

% Left disk yellow, at x=1
DrawDisk(1,0,r,yellow)
% Right disk black, at x=5
DrawDisk(5,0,r,black)

% Middle disk with average color, at x=3
colr= 0.5*yellow + 0.5*black;
DrawDisk(3,0,r,colr)
```

.5 * | 1 | 1 | 0 | → | .5 | .5 | 0 |

.5 * | 0 | 0 | 0 | → | 0 | 0 | 0 |

Vectorized multiplication

Vectorized code allows an operation on multiple values at the same time

```
yellow= [1 1 0];
black = [0 0 0];

% Average color via vectorized op
colr= 0.5*yellow + 0.5*black;

% Average color via scalar op
for k = 1:length(black)
   colr(k)= 0.5*yellow(k) + 0.5*black(k);
end
```

Vectorized addition

| .5 | .5 | 0 |
+ | 0 | 0 | 0 |
= | .5 | .5 | 0 |

Operation performed on vectors

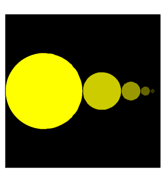
Operation performed on scalars

```
% Draw n fading Xeno disks
d= 1;
x= 0;  % Left tangent point
yellow= [1 1 0];
black=  [0 0 0];
for k= 1:n
   % Compute color of kth disk

   colr= ___*black + ___*yellow;
   % Draw kth disk
   DrawDisk(x+d/2, 0, d/2, colr)
   x= x+d;
   d= d/2;
end
```

Use ***linear interpolation*** to obtain the colors. Each disk has a color that is a linear combination of yellow and black. Let f be a fraction in (0,1) …

```
f= ???
colr= f*black + (1-f)*yellow;
```



Linear interpolation

x	g(x)
:	:
9	110
10	118
10.25	?
10.50	?
10.75	?
11	126
12	134
:	:

$g(10.5) = \frac{1}{2}\, g(11) + \frac{1}{2}\, g(10)$

$g(10) = 0/4 \cdot g(11) + 4/4 \cdot g(10)$
$g(10.25) = 1/4 \cdot g(11) + 3/4 \cdot g(10)$
$g(10.50) = 2/4 \cdot g(11) + 2/4 \cdot g(10)$
$g(10.75) = 3/4 \cdot g(11) + 1/4 \cdot g(10)$
$g(11) = 4/4 \cdot g(11) + 0/4 \cdot g(10)$

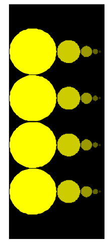
$\boxed{f \cdot g(11) + (1-f) \cdot g(10)}$

```
% Draw n fading Xeno disks
d= 1;
x= 0;  % Left tangent point
yellow= [1 1 0];
black=  [0 0 0];
for k= 1:n
   % Compute color of kth disk
   f= ???
   colr= f*black + (1-f)*yellow;
   % Draw kth disk
   DrawDisk(x+d/2, 0, d/2, colr)
   x= x+d;
   d= d/2;
end
```

A k/n
B k/(n-1)
C (k-1)/n
D (k-1)/(n-1)
E (k-1)/(n+1)

Lecture 12 42

Rows of Xeno disks



```
for y = __:__:__
    Code to draw one
    row of Xeno disks
    at some y-coordinate
end
```

Be careful with initializations

Lecture 12 45

Where to put the loop header `for y=__:__:__`

```
A ⇨  yellow=[1 1 0];  black=[0 0 0];
B ⇨  d= 1;
C ⇨  x= 0;
D ⇨  for k= 1:n
        % Compute color of kth disk
        f= (k-1)/(n-1);
        colr= f*black + (1-f)*yellow;
        % Draw kth disk
        DrawDisk(x+d/2, 0, d/2, colr)
        x=x+d;  d=d/2;
     end
end
```

y

February 23, 2010 Lecture 12 47

Does this script print anything?

```
k = 0;
while 1 + 1/2^k > 1
   k = k+1;
end
disp(k)
```

49

Computer Arithmetic—floating point arithmetic

Suppose you have a calculator with a window like this:

+	2	4	1	-	3

representing 2.41×10^{-3}

50

Floating point addition

+	2	4	1	-	3
+	1	0	0	-	3

Result:

+	3	4	1	-	3

51

Floating point addition

+	2	4	1	-	3

+	1	0	0	-	6

Result:

+	2	4	1	-	3

Not enough room to represent .002411

54

The loop DOES terminate given the limitations of floating point arithmetic!

```
k = 0;
while 1 + 1/2^k > 1
   k = k+1;
end
disp(k)
```

1 + 1/2^53 is calculated to be just 1, so "53" is printed.

55

Patriot missile failure

www.namsa.nato.int/gallery/systems

In 1991, a Patriot Missile failed, resulting in 28 deaths and about 100 injured. The cause?

0.1

Lecture 12 56

Inexact representation of time/number

- System clock represented time in tenths of a second: a clock tick every 1/10 of a second
- Time = number of clock ticks x 0.1

"exact" value

.000110011001100110011001100110011…

.00011001100110011001100110011 value in Patriot system

Error of .000000095 every clock tick

Lecture 12 58

Resulting error

… after 100 hours

.000000095 x (100x60x60)

0.34 second

At a velocity of 1700 m/s, missed target by more than 500 meters!

Lecture 12 59

Computer arithmetic is *inexact*

- There is error in computer arithmetic—floating point arithmetic—due to limitation in "hardware." Computer memory is finite.
- What is $1 + 10^{-16}$?
  - 1.0000000000000001 in real arithmetic
  - 1 in floating point arithmetic (IEEE)
- Read Sec 4.3

Lecture 12 60
