

- Today's Lecture:
 - Vectorized computation
 - Introduction to graphics

- Announcements:
 - **Assignment 1b**: due SEP17 at 11:59pm

Monte Carlo Approximation of π

Throw N darts

$$\text{Sq. area} = N = L \times L$$

$$\begin{aligned}\text{Circle area} &= N_{in} \\ &= \pi L^2 / 4\end{aligned}$$

$$\pi = 4 N_{in} / N$$

1. Make a plot
2. Use vectors to store all values
3. Use vectorized arithmetic

Vectorized addition

$$\begin{array}{r} \mathbf{x} \quad \boxed{2 \quad 1 \quad .5 \quad 8} \\ + \quad \mathbf{y} \quad \boxed{1 \quad 2 \quad 0 \quad 1} \\ \hline = \quad \mathbf{z} \quad \boxed{3 \quad 3 \quad .5 \quad 9} \end{array}$$

Matlab code: `z = x + y`

Vectorized subtraction

$$\begin{array}{r} \mathbf{x} \quad \boxed{2 \quad 1 \quad .5 \quad 8} \\ - \quad \mathbf{y} \quad \boxed{1 \quad 2 \quad 0 \quad 1} \\ \hline = \quad \mathbf{z} \quad \boxed{1 \quad -1 \quad .5 \quad 7} \end{array}$$

Matlab code: `z = x - y`

Vectorized code

—a Matlab-specific feature

See Sec 4.1 for list of vectorized arithmetic operations

- Code that performs element-by-element arithmetic/relational/logical operations on array operands in one step
- Scalar operation: $x + y$
where x, y are scalar variables
- **Vectorized code:** $x + y$
where x and/or y are vectors. If x and y are both vectors, they must be of the **same shape and length**

Vectorized multiplication

$$\begin{array}{r} \mathbf{a} \\ \times \\ \hline \mathbf{b} \\ \hline \mathbf{c} \end{array} \quad \begin{array}{|c|c|c|c|} \hline 2 & 1 & .5 & 8 \\ \hline \hline 1 & 2 & 0 & 1 \\ \hline \hline 2 & 2 & 0 & 8 \\ \hline \end{array}$$

Matlab code: `c = a .* b`

Vectorized

element-by-element arithmetic operations on arrays

A dot (\cdot) is necessary in front of these math operators

Shift

$$\begin{array}{r} \mathbf{x} \quad \boxed{3} \\ + \quad \mathbf{y} \quad \boxed{2 \quad 1 \quad .5 \quad 8} \\ \hline = \quad \mathbf{z} \quad \boxed{5 \quad 4 \quad 3.5 \quad 11} \end{array}$$

Matlab code: `z = x + y`

Reciprocate

$$\begin{array}{r} \mathbf{x} \quad \boxed{1} \\ / \quad \mathbf{y} \quad \boxed{2 \quad 1 \quad .5 \quad 8} \\ \hline = \quad \mathbf{z} \quad \boxed{.5 \quad 1 \quad 2 \quad .125} \end{array}$$

Matlab code: $\mathbf{z} = \mathbf{x} \cdot / \mathbf{y}$

Vectorized

element-by-element arithmetic operations between an array and a scalar

$$\text{array} + \text{scalar}$$

$$\text{scalar} + \text{array}$$

$$\text{array} - \text{scalar}$$

$$\text{scalar} - \text{array}$$

$$\text{array} * \text{scalar}$$

$$\text{scalar} * \text{array}$$

$$\text{array} / \text{scalar}$$

$$\text{array} \text{.^} \text{scalar}$$

$$\text{scalar} \text{./} \text{array}$$

$$\text{scalar} \text{.^} \text{array}$$

A dot (.) is necessary in front of these math operators

The dot in $\text{array} \text{.*} \text{scalar}$, $\text{scalar} \text{.*} \text{array}$, $\text{array} \text{./} \text{scalar}$ not necessary but OK

Generating tables and plots

x, y are vectors. A vector is a 1-dimensional list of values

x	sin(x)
0.000	0.000
0.784	0.707
1.571	1.000
2.357	0.707
3.142	0.000
3.927	-0.707
4.712	-1.000
5.498	-0.707
6.283	0.000

```
x= linspace(0,2*pi,9);  
y= sin(x);  
plot(x,y)
```

Note: x, y are shown in **columns** due to space limitation; they should be **rows**.

Does this assign to y the values
 $\sin(0^\circ), \sin(1^\circ), \sin(2^\circ), \dots, \sin(90^\circ)$?

```
x = linspace (0 , pi / 2 , 90) ;
```

```
y = sin (x) ;
```

A: yes

B: no

Plot this!

$$f(x) = \frac{\sin(5x) \exp(-x/2)}{1+x^2}$$

for
 $-2 \leq x \leq 3$

```
x = linspace(-2,3,200);  
y = sin(5*x) .* exp(-x/2) ./ (1 + x.^2);  
plot(x,y)
```

Element-by-element arithmetic
operations on arrays

Element-by-element arithmetic operations on arrays...
Also called “vectorized code”

```
x = linspace(-2, 3, 200);  
y = sin(5*x) .* exp(-x/2) ./ (1 + x.^2);
```

x and y are vectors

Contrast with scalar operations that we’ve used previously...

```
a = 2.1;  
b = sin(5*a);
```

a and b are scalars

The *operators* are (mostly) the same; the operands may be scalars or vectors.

When an operand is a vector, you have “vectorized code.”

Some format commands to use with `plot`

```
xlabel('text for labeling x-axis')
```

```
ylabel('text for labeling y-axis')
```

```
title('text for plot title at top center')
```

```
hold on % hold subsequent plot commands to current axes
```

```
hold off % subsequent plot command refreshes axes--
```

```
erase previous items
```

default

```
close all % close all graphics windows
```

```
axis equal % same scaling for x, y axes
```

```
axis off % hide axes
```

```
axis on % show axes
```

default

Start with drawing a single line segment

```
a= 0; % x-coord of pt 1
```

```
b= 1; % y-coord of pt 1
```

```
c= 5; % x-coord of pt 2
```

```
d= 3; % y-coord of pt 2
```

```
plot([a c], [b d], '-*')
```

x-values
(a vector)

y-values
(a vector)

Line/marker
format

Making an x-y plot

```
a= [0 4 3 8]; % x-coords
```

```
b= [1 2 5 3]; % y-coords
```

```
plot(a, b, '-*')
```

x-values
(a vector)

y-values
(a vector)

Line/marker
format

Making an x-y plot with multiple graphs (lines)

```
a= [0 4 5 8];  
b= [1 2 5 3];  
f= [0 4 6 8 10];  
g= [2 2 6 4 3];  
plot(a,b,'-*',f,g,'c')  
legend('graph 1 name', 'graph 2 name')  
xlabel('x values')  
ylabel('y values')  
title('My graphs', 'FontSize',14)
```

See also [plotComparison.m](#)

Drawing a polygon (multiple line segments)

```
% Draw a rectangle with the lower-left  
% corner at (a,b), width w, height h.  
x= [           ]; % x data  
y= [           ]; % y data  
plot(x, y)
```

Fill in the missing vector values!

Drawing a polygon (multiple line segments)

```
% Draw a rectangle with the lower-left  
% corner at (a,b), width w, height h.  
x= [a  a+w  a+w  a  a ]; % x data  
y= [b  b  b+h  b+h  b ]; % y data  
plot(x, y)
```

2-d array: **matrix**

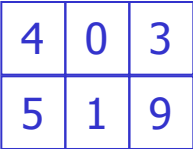

- An array is a **named** collection of **like** data organized into rows and columns
- A 2-d array is a table, called a **matrix**
- Two **indices** identify the position of a value in a matrix, e.g.,

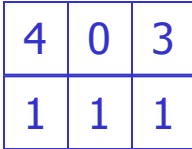

`mat(r, c)`

refers to component in row **r**, column **c** of matrix **mat**

- Array index starts at **1**
- **Rectangular**: all rows have the same #of columns

Creating a matrix

- Built-in functions: `ones`, `zeros`, `rand(I)`
 - E.g., `zeros(2,3)` gives a 2-by-3 matrix of 0s
- “Build” a matrix using square brackets, `[]`, but the dimension must match up:
 - `[x y]` puts `y` to the right of `x`
 - `[x; y]` puts `y` below `x`
 - `[4 0 3; 5 1 9]` creates the matrix 

4	0	3
5	1	9
 - `[4 0 3; ones(1,3)]` gives 

4	0	3
1	1	1
 - `[4 0 3; ones(3,1)]` doesn't work

Function `size` returns the dimensions of a matrix

- `[nr, nc]= size(M)` % nr is #of rows,
% nc is #of columns

- `nr= size(M, 1)` % # of rows

- `nc= size(M, 2)` % # of columns

`% What will M be?`

`M = [ones(1,3) ; 1:4]`

1 1 1 0
1 2 3 4

1 1 1
1 2 3

Error – M not created

What will **A** be?

```
A= [0 0]
```

```
A= [A' ones(2,1)]
```

```
A= [0 0 0 0; A A]
```

Example: minimum value in a matrix

function val = minInMatrix(M)

% val is the smallest value in matrix M

minInMatrix.m

Pattern for traversing a matrix M

```
[nr, nc] = size(M)
for r= 1:nr
    % At row r
    for c= 1:nc
        % At column c (in row r)
        %
        % Do something with M(r,c) ...
    end
end
end
```
