Spring 2021

# Lecture 28

## Linear Regression

# Announcements

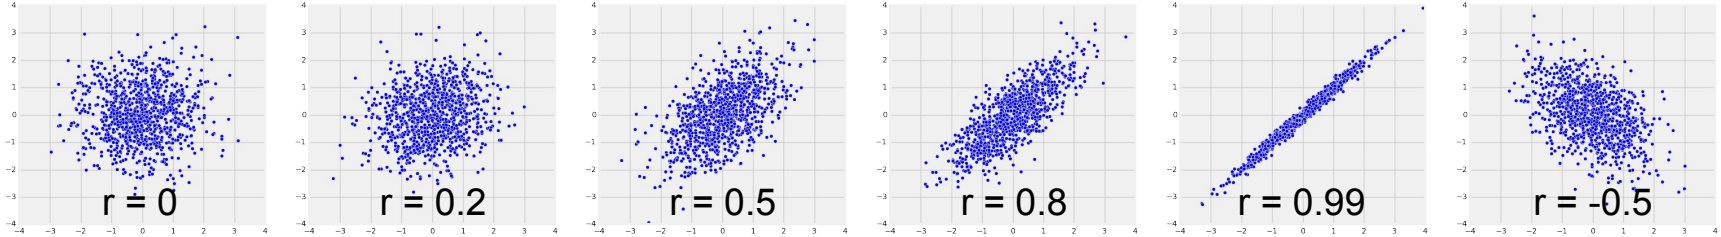
- Project 2, Part 2, due Friday 5:59PM
- Prelim 2, April 20, 8:30PM-10PM in Kennedy 116 (here) for Ithaca-resident students, assigned seating
  - Coverage from Lecture 12 - Lecture 26 (Monday)
  - Review session on Saturday 3:30PM-5:30PM, room Uris G01
  - Review sheet and sample exam posted on Canvas.
  - NB: The sample exam is not one I wrote, and is likely to be somewhat different than what I will do.
  - Table of functions included again, allowed a double-sided sheet of notes you make yourself

# Announcements

- HW 5 out this weekend, not due until Friday 4/30

# The Correlation Coefficient *r*

- Measures linear association
- Based on standard units
- $-1 \le r \le 1$
  - $r = 1$: scatter is perfect straight line sloping up
  - $r = -1$: scatter is perfect straight line sloping down
- $r = 0$: No linear association; *uncorrelated*



# Definition of *r*

**Correlation Coefficient** (*r*) =

| | | | | |
|---|---|---|---|---|
| average of | product of | x in standard units | and | y in standard units |

Measures how clustered the scatter is around a straight line

(Demo)

# Properties of *r*

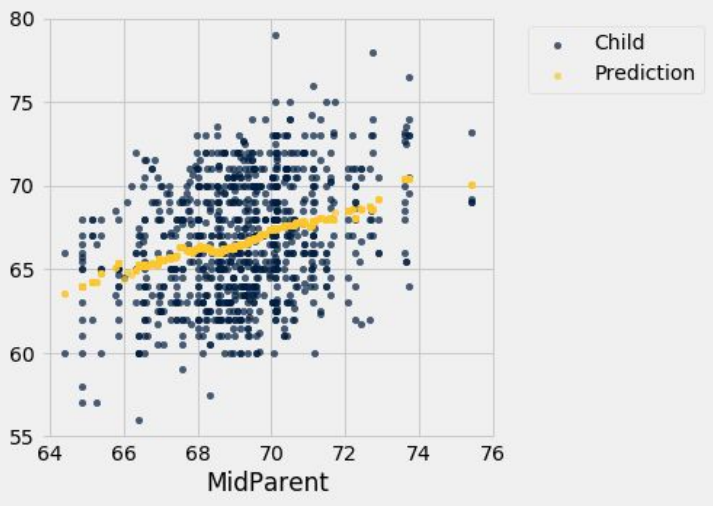
- *r* is a pure number, with no units
- *r* is not affected by changing units of measurement
- *r* is not affected by switching the horizontal and vertical axes

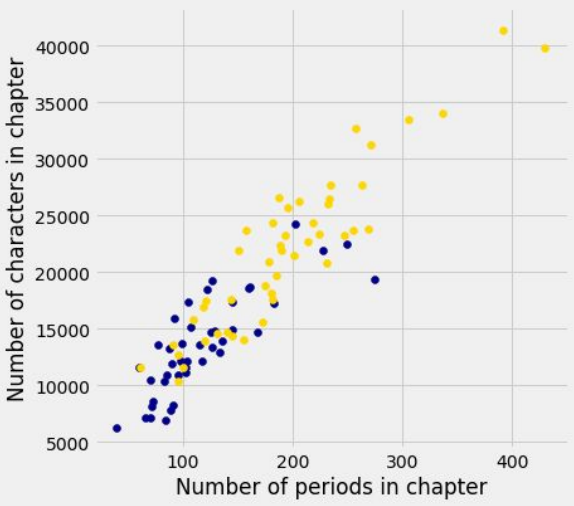
(Demo)

# Prediction

# Prediction

If we have a line describing the relation between two variables, we can make predictions



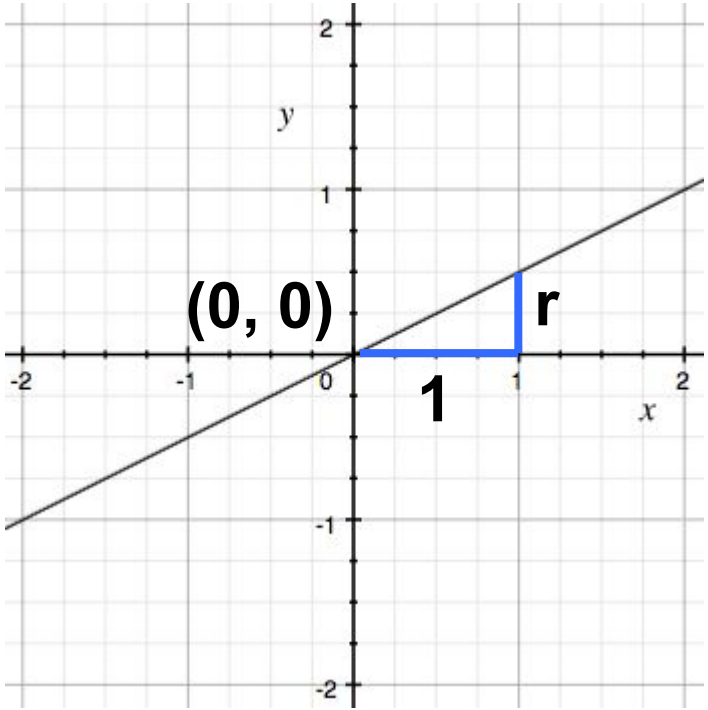


# Prediction

- **Problem:** given a known *x* value, predict *y*, where both are in standard units
- **Solution:**
  - Compute *r*
  - Predict that $y = r * x$
- Why is that a line?

Algebra review:

# Equation of a Line



$$y = r * x$$

In general:

$$y = a * x + b$$

(a is slope, b is intercept)

# Prediction

- **Problem:** given a known *x* value, predict *y*, where both are in standard units
- **Solution:**
  - Compute *r*
  - Predict that $y = r * x$
- Why is that a line?
- Why use *that* line?

(Demo)

# Prediction

- **Problem:** given a known *x* value, predict *y*, where both are in standard units
- **Solution:**
  - Compute *r*
  - Predict that $y = r * x$
- Why is that a line?
- Why use *that* line?
  - It is a version of the graph of averages, smoothed to a line (Demo)

# Prediction

- **Predict** $y = r * x$ (in standard units)

- Example:
  - $x = 2$ (in standard units)
  - $r = .75$
  - What is the prediction for $y$ (in standard units)?
    - A. 0.0
    - B. 0.75
    - C. 1.5
    - D. 2.0

# Prediction

- **Predict** $y = r * x$ (in standard units)

- Example:
  - A course has a typical prelim (mean=70, std=10), and a hard final (mean=50, std=12)
  - The scores on the exams look linearly related when visualized, with $r = .75$
  - **Predict** a student's final exam score, given that their prelim score was 90 *(go ahead and work on that)*

# Final score?

50

67.5

68

74

None of the above

# Prediction

- Prelim: mean=70, std=10
  - x = 90 = 70 + 2*10 in original units = 2 standard units
- Prediction:
  - y = r * x = .75 * 2 = 1.5 standard units
- Final: mean=50, std=12
  - y = 50 + 1.5 * 12 = **68** in original units

# Prediction

- **Predict** $y = r * x$ (in standard units)
- If $r$ = .75 and $x$ is 2 std above mean, then prediction for $y$ is 1.5 std above mean
- So $y$ predicted to be closer to mean than $x$

- "Regression to the mean"
  - Children with exceptionally tall parents tend not to be as tall
  - Galton called it "regression to mediocrity"

(Demo)

# Linear Regression

(Demo)

# Equation for regression line

(y in su) = r * (x in su)

# Equation for regression line

$$(y \text{ in su}) = r * \frac{x - \text{mean(all x)}}{\text{std(all x)}}$$

# Equation for regression line

$$\frac{y - \text{mean(all y)}}{\text{std(all y)}} = r * \frac{x - \text{mean(all x)}}{\text{std(all x)}}$$

# Equation for regression line

$$\frac{y - \text{mean(all y)}}{\text{std(all y)}} = r * \frac{x - \text{mean(all x)}}{\text{std(all x)}}$$

Do some algebra to put that in the form y = slope * x + intercept...

# Slope and Intercept

$$y = \text{slope} * x + \text{intercept}$$

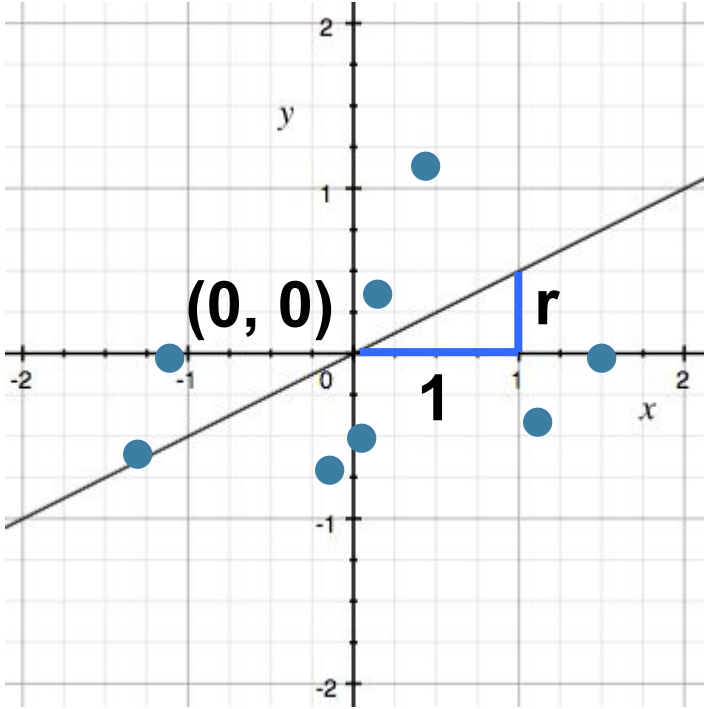
$$\textbf{slope of the regression line} = r \cdot \frac{\text{SD of } y}{\text{SD of } x}$$

$$\textbf{intercept of the regression line} = \text{average of } y - \text{slope} \cdot \text{average of } x$$

(Demo)

# Regression Line

## Standard Units



## Original Units
