

Note: Long-haul freight trucks typically serve locations at least 50 miles apart, excluding trucks that are used in movements by multiple modes and mail.

## SPANNING TREES

Lecture 21
CS2110 - Spring 2014

## A lecture with two distinct parts

$\square$ Part I: Finishing our discussion of graphs
$\square$ Short review of DFS and BFS.
$\square$ Spanning trees
$\square$ Definitions, algorithms (Prim's, Kruskal' s)
$\square$ Travelling salesman problem

## Undirected Trees

- An undirected graph is a tree if there is exactly one simple path between any pair of vertices

## Facts About Trees

- $|\mathrm{E}|=|\mathrm{V}|-1$
- connected
- no cycles

In fact, any two of these properties imply the third, and
 imply that the graph
is a tree

## Spanning Trees

A spanning tree of a connected undirected graph $(\mathrm{V}, \mathrm{E})$ is a subgraph $\left(\mathrm{V}, \mathrm{E}^{\prime}\right)$ that is a tree

## Spanning Trees

A spanning tree of a connected undirected graph $(\mathrm{V}, \mathrm{E})$ is a subgraph $\left(\mathrm{V}, \mathrm{E}^{\prime}\right)$ that is a tree

- Same set of vertices V
- $\mathrm{E}^{\prime} \subseteq \mathrm{E}$
- $\left(\mathrm{V}, \mathrm{E}^{\prime}\right)$ is a tree

## Finding a Spanning Tree

A subtractive method

- Start with the whole graph - it is connected
- If there is a cycle, pick an edge on the cycle, throw it out - the graph is still connected (why?)
- Repeat until no more cycles

## Finding a Spanning Tree

A subtractive method

- Start with the whole graph - it is connected
- If there is a cycle, pick an edge on the cycle, throw it out - the graph is still connected (why?)
- Repeat until no more cycles

## Finding a Spanning Tree

A subtractive method

- Start with the whole graph - it is connected
- If there is a cycle, pick an edge on the cycle, throw it out - the graph is still connected (why?)
- Repeat until no more cycles

## Finding a Spanning Tree

An additive method

- Start with no edges - there are no cycles
- If more than one connected component, insert an edge between. them - still no cycles (why?)
- Repeat until only one component

## Finding a Spanning Tree

An additive method

- Start with no edges - there are no cycles
- If more than one connected component, insert an edge between them - still no cycles (why?)
- Repeat until only one component

## Finding a Spanning Tree

An additive method

- Start with no edges - there are no cycles
- If more than one connected component, insert an edge between them - still no cycles (why?)
- Repeat until only one component

## Finding a Spanning Tree

An additive method

- Start with no edges - there are no cycles
- If more than one connected component, insert an edge between them - still no cycles (why?)
- Repeat until only one component

## Finding a Spanning Tree

An additive method

- Start with no edges - there are no cycles
- If more than one connected component, insert an edge between. them - still no cycles (why?)
- Repeat until only one component

## Finding a Spanning Tree

An additive method

- Start with no edges - there are no cycles
- If more than one connected component, insert an edge between. them - still no cycles (why?)
- Repeat until only one component

## Minimum Spanning Trees

- Suppose edges are weighted, and we want a spanning tree of minimum cost (sum of edge weights)
- Some graphs have exactly one minimum spanning tree. Others have multiple trees with the same cost, any of which is a minimum spanning tree

## Minimum Spanning Trees

- Suppose edges are weighted, and we want a spanning tree of minimum cost (sum of edge weights)
- Useful in network routing \& other applications
- For example, to
 stream a video

## 3 Greedy Algorithms

A. Find a max weight edge - if it is on a cycle, throw it out, otherwise keep it

## 3 Greedy Algorithms

A. Find a max weight edge - if it is on a cycle, throw it out, otherwise keep it

## 3 Greedy Algorithms

A. Find a max weight edge - if it is on a cycle, throw it out, otherwise keep it

## 3 Greedy Algorithms

A. Find a max weight edge - if it is on a cycle, throw it out, otherwise keep it

## 3 Greedy Algorithms

A. Find a max weight edge - if it is on a cycle, throw it out, otherwise keep it

## 3 Greedy Algorithms

A. Find a max weight edge - if it is on a cycle, throw it out, otherwise keep it

## 3 Greedy Algorithms

A. Find a max weight edge - if it is on a cycle, throw it out, otherwise keep it

## 3 Greedy Algorithms

A. Find a max weight edge - if it is on a cycle, throw it out, otherwise keep it

## 3 Greedy Algorithms

B. Find a min weight edge - if it forms a cycle with edges already taken, throw it out, otherwise keep it

Kruskal's algorithm

## 3 Greedy Algorithms

B. Find a min weight edge - if it forms a cycle with edges already taken, throw it out, otherwise keep it

Kruskal's algorithm

## 3 Greedy Algorithms

B. Find a min weight edge - if it forms a cycle with edges already taken, throw it out, otherwise keep it

Kruskal's algorithm

## 3 Greedy Algorithms

B. Find a min weight edge - if it forms a cycle with edges already taken, throw it out, otherwise keep it

Kruskal's algorithm

## 3 Greedy Algorithms

B. Find a min weight edge - if it forms a cycle with edges already taken, throw it out, otherwise keep it

Kruskal's algorithm

## 3 Greedy Algorithms

B. Find a min weight edge - if it forms a cycle with edges already taken, throw it out, otherwise keep it

Kruskal's algorithm

## 3 Greedy Algorithms

B. Find a min weight edge - if it forms a cycle with edges already taken, throw it out, otherwise keep it

Kruskal's algorithm

## 3 Greedy Algorithms

C. Start with any vertex, add min weight edge extending that connected component that does not form a cycle

Prim's algorithm (reminiscent of
Dijkstra's algorithm)

## 3 Greedy Algorithms

C. Start with any vertex, add min weight edge extending that connected component that does not form a cycle

Prim's algorithm (reminiscent of
Dijkstra's algorithm)

## 3 Greedy Algorithms

C. Start with any vertex, add min weight edge extending that connected component that does not form a cycle

Prim's algorithm (reminiscent of
Dijkstra's algorithm)

## 3 Greedy Algorithms

C. Start with any vertex, add min weight edge extending that connected component that does not form a cycle

Prim's algorithm (reminiscent of
Dijkstra's algorithm)

## 3 Greedy Algorithms

C. Start with any vertex, add min weight edge extending that connected component that does not form a cycle

Prim's algorithm (reminiscent of
Dijkstra's algorithm)

## 3 Greedy Algorithms

C. Start with any vertex, add min weight edge extending that connected component that does not form a cycle

Prim's algorithm (reminiscent of
Dijkstra's algorithm)

## 3 Greedy Algorithms

C. Start with any vertex, add min weight edge extending that connected component that does not form a cycle

Prim's algorithm (reminiscent of
Dijkstra's algorithm)

## 3 Greedy Algorithms

- When edge weights are all distinct, or if there is exactly one minimum spanning tree, the 3 algorithms all find the identical tree

## Prim's Algorithm

```
prim(s) {
    D[s] = 0; mark s; //start vertex
    while (some vertices are unmarked) {
        v = unmarked vertex with smallest D;
        mark v;
        for (each w adj to v) {
                D[w] = min(D[w], c(v,w));
        }
    }
}
```

- O( $\mathrm{n}^{2}$ ) for adj matrix
- While-loop is executed $n$ times
- For-loop takes O(n) time
$\square \mathrm{O}(\mathrm{m}+\mathrm{n} \log \mathrm{n})$ for adj list
- Use a PQ
- Regular PQ produces time $\mathrm{O}(\mathrm{n}+\mathrm{m} \log \mathrm{m})$
- Can improve to $O(m+n \log n)$ using a fancier heap

## Greedy Algorithms

$\square$ These are examples of Greedy Algorithms
$\square$ The Greedy Strategy is an algorithm design technique

- Like Divide \& Conquer
$\square$ Greedy algorithms are used to solve optimization problems
- The goal is to find the best solution
$\square$ Works when the problem has the greedy-choice property
- A global optimum can be reached by making locally optimum choices
- Example: the Change Making Problem: Given an amount of money, find the smallest number of coins to make that amount
- Solution: Use a Greedy Algorithm
- Give as many large coins as you can
- This greedy strategy produces the optimum number of coins for the US coin system
- Different money system $\Rightarrow$ greedy strategy may fail
- Example: old UK system

## Similar Code Structures

- Breadth-first-search (bfs)
-best: next in queue
-update: $\mathrm{D}[\mathrm{w}]=\mathrm{D}[\mathrm{v}]+1$
- Dijkstra's algorithm
-best: next in priority queue
- update: $\mathrm{D}[\mathrm{w}]=\min (\mathrm{D}[\mathrm{w}], \mathrm{D}[\mathrm{v}]+\mathrm{c}(\mathrm{v}, \mathrm{w}))$
- Prim's algorithm
-best: next in priority queue
- update: $D[w]=\min (D[w], c(v, w))$
here $c(v, w)$ is the $v \rightarrow w$ edge weight

## Traveling Salesman Problem

$\square$ Given a list of cities and the distances between each pair, what is the shortest route that visits each city exactly once and returns to the origin city?
$\square$ Basically what we want the butterfly to do in A6! But we don' $t$ mind if the butterfly revisits a city (Tile), or doesn' $\dagger$ use the very shortest possible path.
$\square$ The true TSP is very hard (NP complete)... for this we want the perfect answer in all cases, and can' $\dagger$ revisit.
$\square$ Most TSP algorithms start with a spanning tree, then "evolve" it into a TSP solution. Wikipedia has a lot of information about packages you can download...
