Machine language represents program as numbers

- Store in / fetch from memory like other data
- 2 new registers:
 - Program counter (PC): address of next instruction
 - Instruction register (IR): current instruction

Revolutionary idea: a program is *just data*
→ von Neumann Architecture

Alternative:

- Separate memory systems for code and data
→ Harvard Architecture

MIPS R3000 ISA (Instruction Set Architecture)

Interface between hardware and software

- memory: load, store, ...
- computational: add, sub, mul, ...
- control: jump, branch, ...
- floating point, cpu and memory management, ...

Why?

```
void A() {  
    for (int i = 0; i < 4096; i++)  
        for (int j = 0; j < 4096; j++)  
            v[i][j] = f(v[i][j], i, j);  
}
```

0.45 sec, (0.12 sec optimized)

```
void B() {  
    for (int j = 0; j < 4096; j++)  
        for (int i = 0; i < 4096; i++)  
            v[i][j] = f(v[i][j], i, j);  
}

The number of transistors integrated on a single die will double every 24 months...

Why?

- **Basic knowledge needed for *all* other areas of CS:**
operating systems, compilers, ...
- **Levels are not independent**
hardware design $\leftrightarrow$ software design $\leftrightarrow$ performance
- **Crossing boundaries is hard but important**
device drivers
- **Good design techniques**
abstraction, layering, pipelining, parallel vs. serial, ...
- **Understand where the world is going**
