P & H Chapter 5.1, 5.2 (except writes)

CPU clock rates $\sim 0.2\text{ns} - 2\text{ns}$ (5GHz-500MHz)

Technology	Capacity	\$/GB	Latency
Tape	1 TB	\$.17	100s of seconds
Disk	2 TB	\$.03	Millions of cycles (ms)
SSD (Flash)	128 GB	\$2	Thousands of cycles (us)
DRAM	8 GB	\$10	50-300 cycles (10s of ns)
SRAM off-chip	8 MB	\$4000	5-15 cycles (few ns)
SRAM on-chip	256 KB	???	1-3 cycles (ns)

Others: **eDRAM** aka **1-T SRAM**, FeRAM, CD, DVD, ...

Q: Can we create illusion of cheap + large + fast?

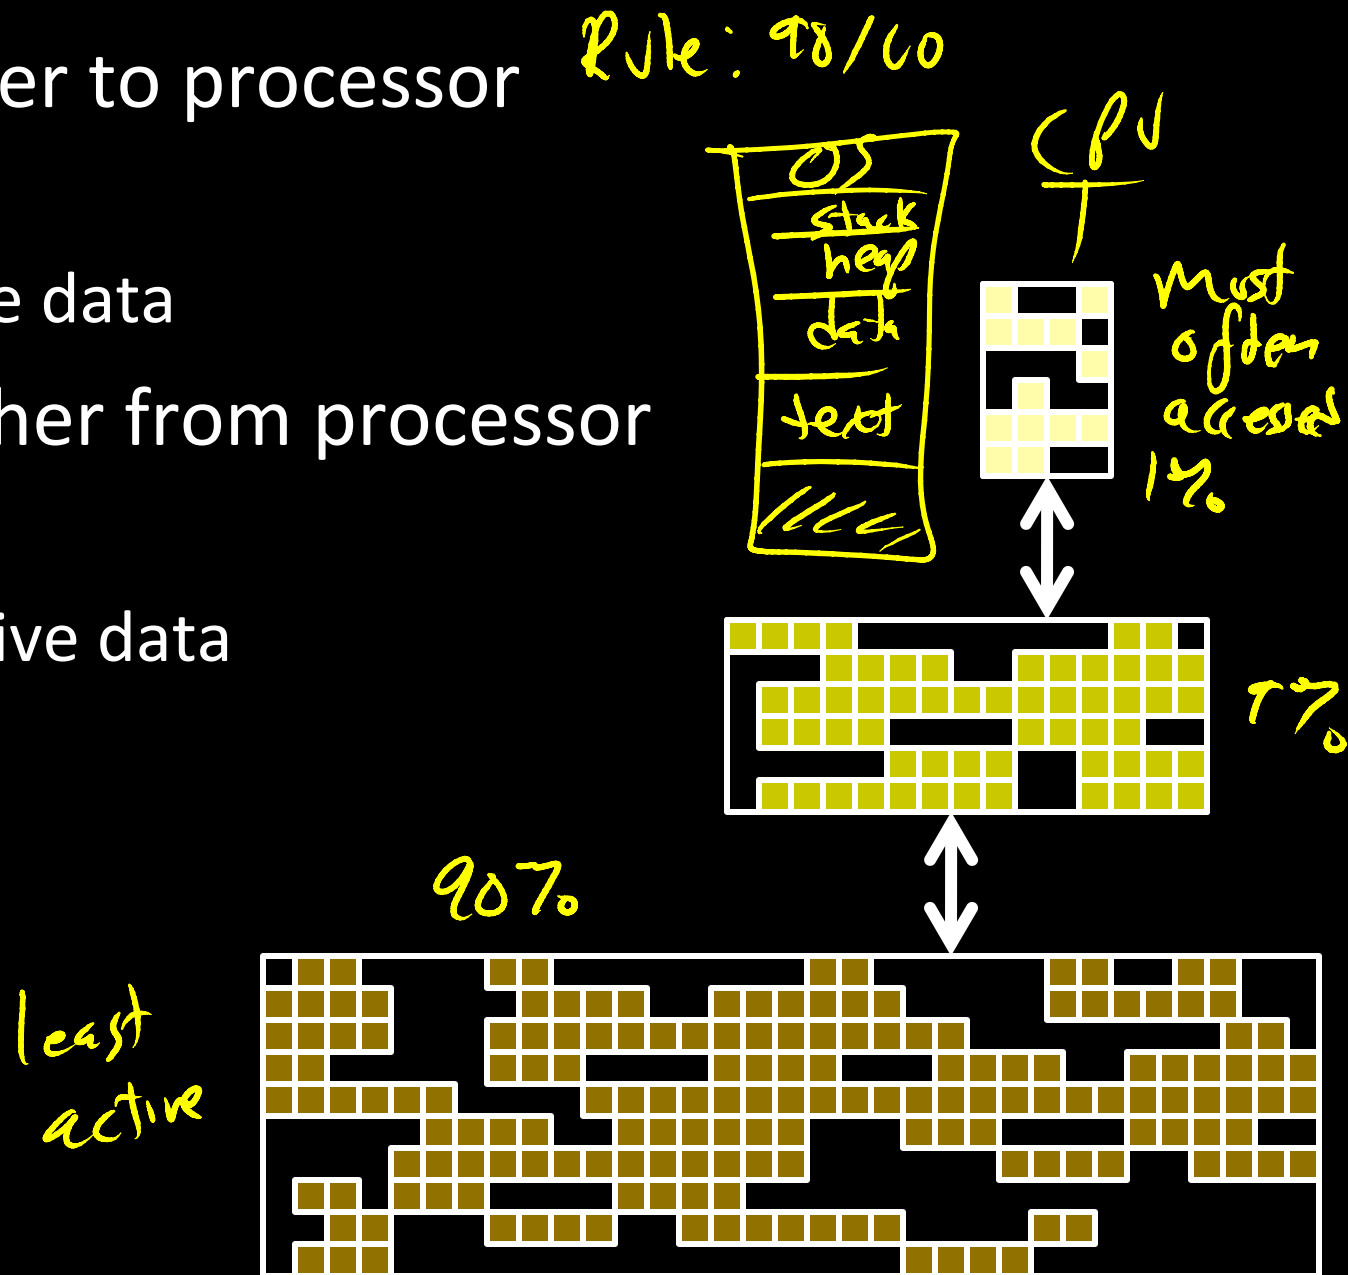

These are rough numbers: mileage may vary for latest/greatest
Caches usually made of SRAM (or eDRAM)

Memory closer to processor

- small & fast
- stores active data

Memory farther from processor

- big & slow
- stores inactive data

Assumption: Most data is not active.

Q: How to decide what is active?

A: Some committee decides

A: Programmer decides

A: Compiler decides

A: OS decides at run-time

A: Hardware decides
at run-time

Q: What is “active” data? *Data that will be accessed soon*

If Mem[x] is was accessed *recently*... *predict future*

... then Mem[x] is likely to be accessed *soon*

- Exploit **temporal locality**:

put recently accessed Mem[x] higher

... then Mem[x ± ε] is likely to be accessed *soon*

- Exploit **spatial locality**:

put entire block containing Mem[x] higher

int n = 4;
```

```
int k[] = { 3, 14, 0, 10 };
```

```
int fib(int i) {
    if (i <= 2) return i;
    else return fib(i-1)+fib(i-2);
}
```

```
int main(int ac, char **av) {
    for (int i = 0; i < n; i++) {
        printi(fib(k[i]));
        prints("\n");
    }
}
```

Memory closer to processor is fast but small

- usually stores **subset** of memory farther away
 - “strictly inclusive”
- alternatives:
 - strictly exclusive
 - mostly inclusive

- Transfer whole **blocks** (cache lines):

4kb: disk \leftrightarrow ram

256b: ram \leftrightarrow L2

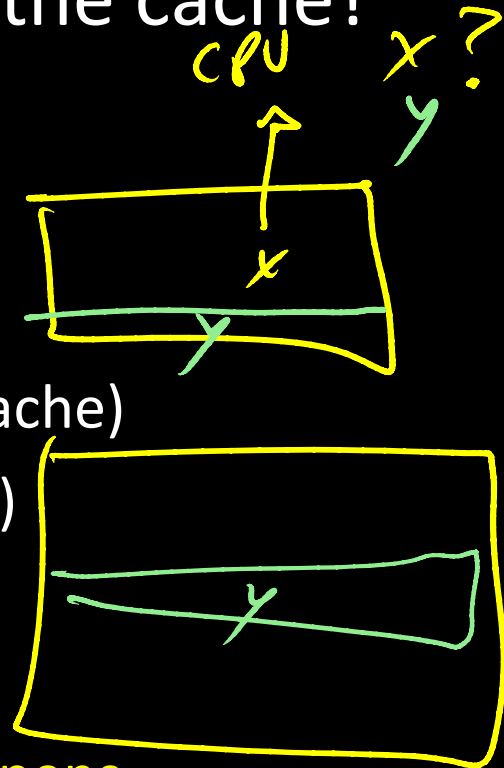

64b: L2 \leftrightarrow L1

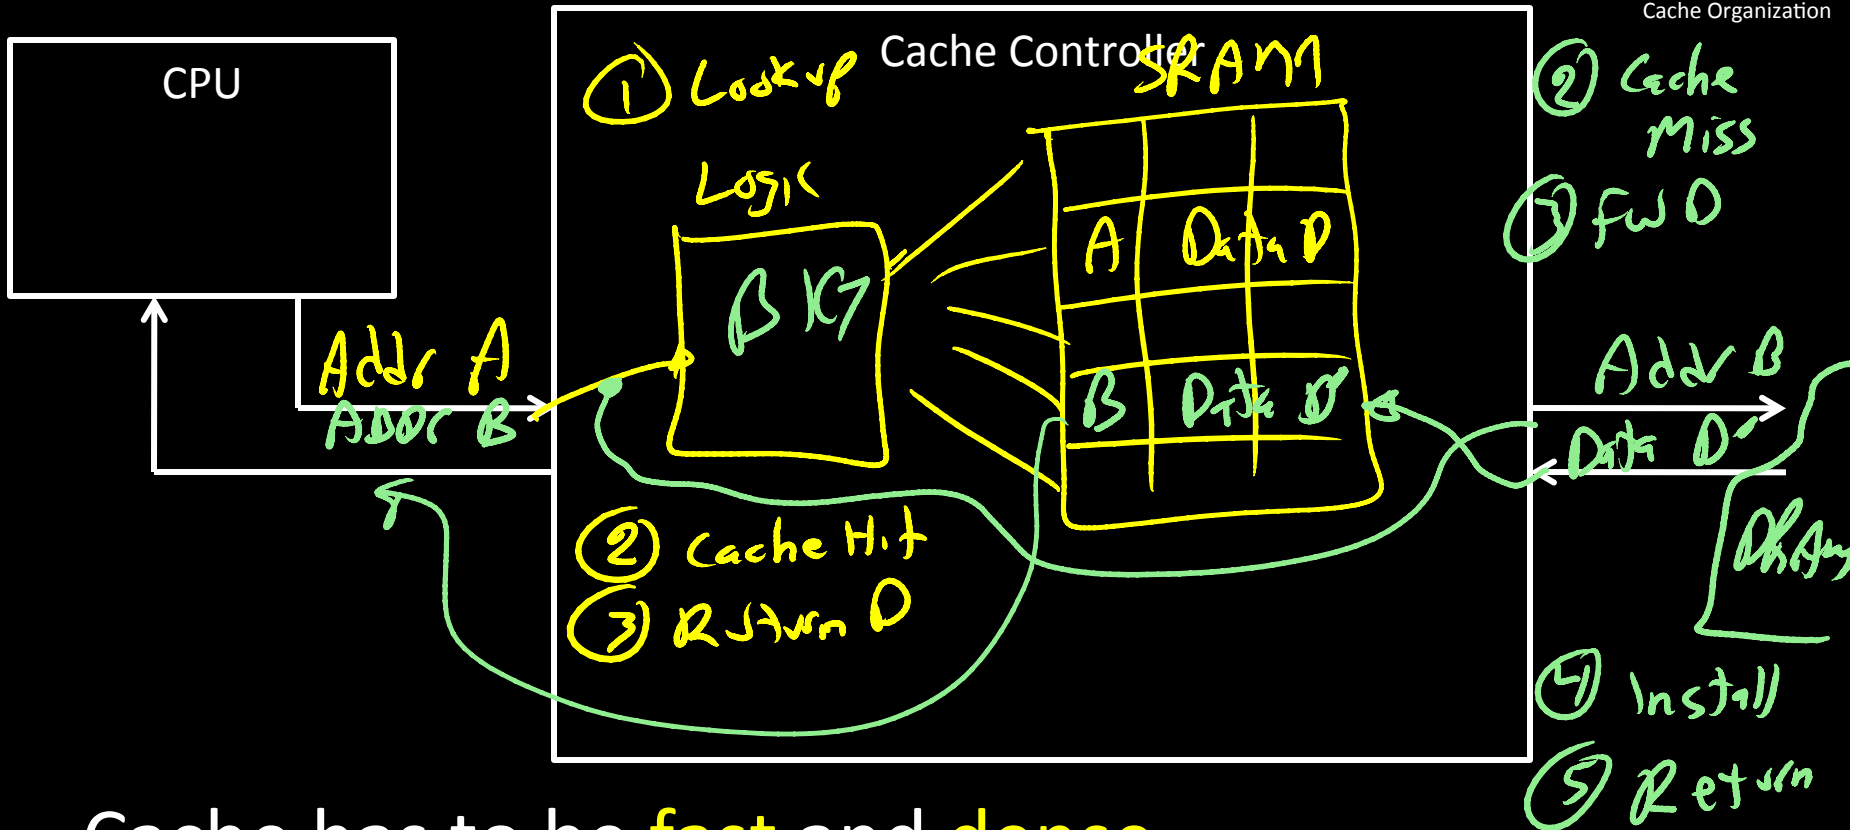

Processor tries to access Mem[x]

Check: is block containing Mem[x] in the cache?

- Yes: **cache hit**
 - return requested data from cache line
- No: **cache miss**
 - read block from memory (or lower level cache)
 - (evict an existing cache line to make room)
 - place new block in cache
 - return requested data
 - and stall the pipeline while all of this happens

Cache has to be **fast** and **dense**

- Gain speed by performing lookups in parallel
 - but requires die real estate for lookup logic
- Reduce lookup logic by **limiting where in the cache a block might be placed**
 - but might reduce cache effectiveness

A given data block can be placed...

- ... in any cache line → Fully Associative
- ... in exactly one cache line → Direct Mapped
- ... in a small set of cache lines → Set Associative

Direct Mapped Cache

- Each block number mapped to a single cache line index
- Simplest hardware

Direct Mapped Cache

- Each block number mapped to a single cache line index
- Simplest hardware

Assume sixteen 64-byte cache lines

0x7FFF3D4D

= 0111 1111 1111 1111 0011 1101 0100 1101

Need meta-data for each cache line:

- valid bit: is the cache line non-empty?
- tag: which block is stored in this line (if valid)

Q: how to check if X is in the cache?

Q: how to clear a cache line?

Using **byte addresses** in this example! Addr Bus = 5 bits

n bit index, m bit offset

Q: How big is cache (data only)?

Q: How much SRAM needed (data + overhead)?

Cache Performance (very simplified):

L1 (SRAM): 512 x 64 byte cache lines, direct mapped

Data cost: 3 cycle per word access

Lookup cost: 2 cycle

Mem (DRAM): 4GB

Data cost: 50 cycle per word, plus 3 cycle per consecutive word

Performance depends on:

Access time for hit, miss penalty, hit rate

Cache misses: classification

The line is being referenced for the first time

- Cold (aka Compulsory) Miss

The line was in the cache, but has been evicted

Q: How to avoid...

Cold Misses

- Unavoidable? The data was never in the cache...
- Prefetching!

Other Misses

- Buy more SRAM
- Use a more flexible cache design

Bigger cache doesn't always help...

Mem access trace: 0, 16, 1, 17, 2, 18, 3, 19, 4, ...

Hit rate with four direct-mapped 2-byte cache lines?

With eight 2-byte cache lines?

With four 4-byte cache lines?

Cache misses: classification

The line is being referenced for the first time

- Cold (aka Compulsory) Miss

The line was in the cache, but has been evicted...

... because some other access with the same index

- Conflict Miss

... because the cache is too small

- i.e. the *working set* of program is larger than the cache
- Capacity Miss

Q: How to avoid...

Cold Misses

- Unavoidable? The data was never in the cache...
- Prefetching!

Capacity Misses

- Buy more SRAM

Conflict Misses

- Use a more flexible cache design

A given data block can be placed...

- ... in any cache line → **Fully Associative**
- ... in exactly one cache line → **Direct Mapped**
- ... in a small set of cache lines → **Set Associative**

m bit offset , 2^n cache lines

Q: How big is cache (data only)?

Q: How much SRAM needed (data + overhead)?

Fully-associative reduces conflict misses...

... assuming good eviction strategy

Mem access trace: 0, 16, 1, 17, 2, 18, 3, 19, 4, 20, ...

Hit rate with four fully-associative 2-byte cache lines?

... but large block size can still reduce hit rate

vector add trace: 0, 100, 200, 1, 101, 201, 2, 202, ...

Hit rate with four fully-associative 2-byte cache lines?

With two fully-associative 4-byte cache lines?

Cache misses: classification

Cold (aka Compulsory)

- The line is being referenced for the first time

Capacity

- The line was evicted because the cache was too small
- i.e. the *working set* of program is larger than the cache

Conflict

- The line was evicted because of another access whose index conflicted

Caching assumptions

- small working set: 90/10 rule
- can predict future: spatial & temporal locality

Benefits

- big & fast memory built from (big & slow) + (small & fast)

Tradeoffs:

associativity, line size, hit cost, miss penalty, hit rate

- Fully Associative → higher hit cost, higher hit rate
- Larger block size → lower hit cost, higher miss penalty

Next up: other designs; writing to caches
