# CS 4110 – Programming Languages and Logics Lecture #3: Inductive definitions and proofs

In this lecture, we will use the semantics of our simple language of arithmetic expressions,

$$e ::= x \mid n \mid e_1 + e_2 \mid e_1 * e_2 \mid x := e_1 ; e_2,$$

to express useful program properties, and we will prove these properties by induction.

## 1 Program Properties

There are a number of interesting questions about a language one can ask: Is it deterministic? Are there non-terminating programs? What sorts of errors can arise during evaluation? Having a formal semantics allows us to express these properties precisely.

• **Determinism:** Evaluation is deterministic,

$$\forall e \in \mathbf{Exp}. \ \forall \sigma, \sigma', \sigma'' \in \mathbf{Store}. \ \forall e', e'' \in \mathbf{Exp}.$$
 if  $\langle \sigma, e \rangle \rightarrow \langle \sigma', e' \rangle$  and  $\langle \sigma, e \rangle \rightarrow \langle \sigma'', e'' \rangle$  then  $e' = e''$  and  $\sigma' = \sigma''$ .

• Termination: Evaluation of every expression terminates,

$$\forall e \in \mathbf{Exp}. \ \forall \sigma \in \mathbf{Store}. \ \exists \sigma' \in \mathbf{Store}. \ \exists e' \in \mathbf{Exp}. \ \langle \sigma, e \rangle \to^* \ \langle \sigma', e' \rangle \ \text{and} \ \langle \sigma', e' \rangle \not\rightarrow,$$
 where  $\langle \sigma', e' \rangle \not\rightarrow$  is shorthand for  $\neg (\exists \sigma'' \in \mathbf{Store}. \ \exists e'' \in \mathbf{Exp}. \ \langle \sigma', e' \rangle \to \langle \sigma'', e'' \rangle).$ 

It is tempting to want the following soundness property,

• Soundness: Evaluation of every expression yields an integer,

$$\forall e \in \text{Exp. } \forall \sigma \in \text{Store. } \exists \sigma' \in \text{store. } \exists n' \in \text{Int. } \langle \sigma, e \rangle \rightarrow^* \langle \sigma', n' \rangle$$

but unfortunately it does not hold in our language! For example, consider the totally-undefined function  $\sigma$  and the expression i+j. The configuration  $\langle \sigma, i+j \rangle$  is stuck—it has no possible transitions—but i+j is not an integer. The problem is that i+j has free variables but  $\sigma$  does not contain mappings for those variables.

To fix this problem, we can restrict our attention to *well-formed* configurations  $\langle \sigma, e \rangle$ , where  $\sigma$  is defined on (at least) the free variables in e. This makes sense as evaluation typically starts with a *closed* expression. We can define the set of free variables of an expression as follows:

$$\begin{array}{cccc} fvs(x) & \triangleq & \{x\} \\ fvs(n) & \triangleq & \{\} \\ fvs(e_1 + e_2) & \triangleq & fvs(e_1) \cup fvs(e_2) \\ fvs(e_1 * e_2) & \triangleq & fvs(e_1) \cup fvs(e_2) \\ fvs(x := e_1 \; ; \; e_2) & \triangleq & fvs(e_1) \cup (fvs(e_2) \setminus \{x\}) \end{array}$$

Now we can formulate two properties that imply a variant of the soundness property above:

• **Progress:** For each expression e and store  $\sigma$  such that the free variables of e are contained in the domain of  $\sigma$ , either e is an integer or there exists a possible transition for  $\langle \sigma, e \rangle$ ,

$$\forall e \in \mathbf{Exp}. \ \forall \sigma \in \mathbf{Store}.$$
 $fvs(e) \subseteq dom(\sigma) \implies e \in \mathbf{Int} \ \text{or} \ (\exists e' \in \mathbf{Exp}. \ \exists \sigma' \in \mathbf{Store}. \ \langle \sigma, e \rangle \rightarrow \langle \sigma', e' \rangle)$ 

• **Preservation:** Evaluation preserves containment of free variables in the domain of the store,

$$\forall e, e' \in \mathbf{Exp}. \ \forall \sigma, \sigma' \in \mathbf{Store}.$$
 $fvs(e) \subseteq dom(\sigma) \ \text{and} \ \langle \sigma, e \rangle \rightarrow \langle \sigma', e' \rangle \implies fvs(e') \subseteq dom(\sigma').$ 

The rest of this lecture shows how can we prove such properties using induction.

## 2 Inductive sets

Induction is an important concept in programming language theory. An *inductively-defined set A* is one that is described using a finite collection of axioms and inductive (inference) rules. Axioms of the form

$$a \in A$$

indicate that a is in the set A. Inductive rules

$$\frac{a_1 \in A \qquad \dots \qquad a_n \in A}{a \in A}$$

indicate that if  $a_1, \ldots, a_n$  are all elements of A, then a is also an element of A.

The set A is the set of all elements that can be inferred to belong to A using a (finite) number of applications of these rules, starting only from axioms. In other words, for each element a of A, we must be able to construct a finite proof tree whose final conclusion is  $a \in A$ .

**Example 1.** The set described by a grammar is an inductive set. For instance, the set of arithmetic expressions can be described with two axioms and three inference rules:

$$\frac{e_1 \in \mathbf{Exp}}{e_1 + e_2 \in \mathbf{Exp}} \qquad \frac{e_1 \in \mathbf{Exp}}{e_1 * e_2 \in \mathbf{Exp}} \qquad \frac{e_1 \in \mathbf{Exp}}{e_1 * e_2 \in \mathbf{Exp}} \qquad \frac{e_1 \in \mathbf{Exp}}{x := e_1 \; ; \; e_2 \in \mathbf{Exp}}$$

These axioms and rules describe the same set of expressions as the grammar:

$$e := x \mid n \mid e_1 + e_2 \mid e_1 * e_2 \mid x := e_1 ; e_2$$

**Example 2.** The natural numbers (expressed here in unary notation) can be inductively defined:

$$\frac{n\in\mathbb{N}}{0\in\mathbb{N}}\qquad \frac{n\in\mathbb{N}}{succ(n)\in\mathbb{N}}$$

**Example 3.** The small-step evaluation relation  $\rightarrow$  is an inductively defined set.

**Example 4.** The multi-step evaluation relation can be inductively defined:

$$\frac{\langle \sigma, e \rangle \to^* \langle \sigma, e \rangle}{\langle \sigma, e \rangle \to^* \langle \sigma', e' \rangle} \xrightarrow{\langle \sigma', e' \rangle \to^* \langle \sigma'', e'' \rangle} \text{Trans}$$

**Example 5.** The set of free variables of an expression e can be inductively defined:

$$\frac{y \in fvs(e_1)}{y \in fvs(y)} \qquad \frac{y \in fvs(e_1)}{y \in fvs(e_1 + e_2)} \qquad \frac{y \in fvs(e_2)}{y \in fvs(e_1 + e_2)} \qquad \frac{y \in fvs(e_1)}{y \in fvs(e_1 * e_2)} \qquad \frac{y \in fvs(e_1)}{y \in fvs(e_1 * e_2)}$$

$$\frac{y \in fvs(e_1)}{y \in fvs(x := e_1 ; e_2)} \qquad \frac{y \neq x \qquad y \in fvs(e_2)}{y \in fvs(x := e_1 ; e_2)}$$

# 3 Inductive proofs

We can prove facts about elements of an inductive set using an inductive reasoning that follows the structure of the set definition.

#### 3.1 Mathematical induction

You have probably seen proofs by induction over the natural numbers, called *mathematical induction*. In such proofs, we typically want to prove that some property P holds for all natural numbers, that is,  $\forall n \in \mathbb{N}$ . P(n). A proof by induction works by first proving that P(0) holds, and then proving for all  $m \in \mathbb{N}$ , if P(m) then P(m + 1). The principle of mathematical induction can be stated succinctly as

$$P(0)$$
 and  $(\forall m \in \mathbb{N}. P(m) \Longrightarrow P(m+1)) \Longrightarrow \forall n \in \mathbb{N}. P(n)$ .

The proposition P(0) is the *basis* of the induction (also called the *base case*) while  $P(m) \Longrightarrow P(m+1)$  is called *induction step* (or the *inductive case*). While proving the induction step, the assumption that P(m) holds is called the *induction hypothesis*.

#### 3.2 Structural induction

Given an inductively defined set *A*, to prove that a property *P* holds for all elements of *A*, we need to show:

1. Base cases: For each axiom

$$\overline{a \in A}$$
,

P(a) holds.

2. Inductive cases: For each inference rule

$$\frac{a_1 \in A \quad \dots \quad a_n \in A}{a \in A},$$

if  $P(a_1)$  and ... and  $P(a_n)$  then P(a).

Note that if the set *A* is the set of natural numbers from Example 2 above, then the requirements for proving that *P* holds for all elements of *A* is equivalent to mathematical induction.

If A describes a syntactic set, then we refer to induction following the requirements above as *structural induction*. If A is an operational semantics relation (such as the small-step operational semantics relation  $\rightarrow$ ) then such an induction is called *induction on derivations*. We will see examples of structural induction and induction on derivations throughout the course.

### 3.3 Example: Progress

Let's consider the progress property defined above, and repeated here:

**Progress:** For each store  $\sigma$  and expression e such that the free variables of e are contained in the domain of  $\sigma$ , either e is an integer or there exists a possible transition for  $\langle \sigma, e \rangle$ :

$$\forall e \in \mathbf{Exp}. \ \forall \sigma \in \mathbf{Store}. \ fvs(e) \subseteq dom(\sigma) \implies e \in \mathbf{Int} \ \text{or} \ (\exists e' \in \mathbf{Exp}. \ \exists \sigma' \in \mathbf{Store}. \ \langle \sigma, e \rangle \rightarrow \langle \sigma', e' \rangle)$$

Let's rephrase this property in terms of an explicit predicate on expressions:

$$P(e) \triangleq \forall \sigma \in \mathbf{Store}. \ fvs(e) \subseteq dom(\sigma) \Longrightarrow e \in \mathbf{Int} \ \text{or} \ (\exists e', \sigma'. \langle \sigma, e \rangle \to \langle \sigma', e' \rangle)$$

The idea is to build a proof that follows the inductive structure given by the grammar:

$$e := x \mid n \mid e_1 + e_2 \mid e_1 * e_2 \mid x := e_1 ; e_2$$

This technique is called "structural induction on e." We analyze each case in the grammar and show that P(e) holds for that case. Since the grammar productions  $e_1 + e_2$  and  $e_1 * e_2$  and  $x := e_1$ ;  $e_2$  are inductive, they are inductive steps in the proof; the cases for x and y are base cases. The proof proceeds as follows.

*Proof.* Let *e* be an expression. We will prove that

$$\forall \sigma \in \mathbf{Store}. \ fvs(e) \subseteq dom(\sigma) \Longrightarrow e \in \mathbf{Int} \ \text{or} \ (\exists e', \sigma'. \langle \sigma, e \rangle \to \langle \sigma', e' \rangle)$$

by structural induction on e. We analyze several cases, one for each case in the grammar for expressions:

**Case** e = x: Let  $\sigma$  be an arbitrary store, and assume that  $fvs(e) \subseteq dom(\sigma)$ . By the definition of fvs we have  $fvs(x) = \{x\}$ . By assumption we have  $\{x\} \subseteq dom(\sigma)$  and so  $x \in dom(\sigma)$ . Let  $n = \sigma(x)$ . By the Var axiom we have  $\{\sigma, x\} \to \{\sigma, n\}$ , which finishes the case.

**Case** e = n: We immediately have  $e \in Int$ , which finishes the case.

**Case**  $e = e_1 + e_2$ : Let  $\sigma$  be an arbitrary store, and assume that  $fvs(e) \subseteq dom(\sigma)$ . We will assume that  $P(e_1)$  and  $P(e_2)$  hold and show that P(e) holds. Let's expand these properties. We have

$$P(e_1) = \forall \sigma \in \text{Store. } fvs(e_1) \subseteq dom(\sigma) \Longrightarrow e_1 \in \text{Int or } (\exists e', \sigma'. \langle \sigma, e_1 \rangle \to \langle \sigma', e' \rangle)$$
  
 $P(e_2) = \forall \sigma \in \text{Store. } fvs(e_2) \subseteq dom(\sigma) \Longrightarrow e_2 \in \text{Int or } (\exists e', \sigma'. \langle \sigma, e_2 \rangle \to \langle \sigma', e' \rangle)$ 

and want to prove:

$$P(e_1 + e_2) = \forall \sigma \in \mathbf{Store}. \ fvs(e_1 + e_2) \subseteq dom(\sigma) \Longrightarrow e_1 + e_2 \in \mathbf{Int} \ \text{or} \ (\exists e', \sigma', \langle \sigma, e_1 + e_2 \rangle \to \langle \sigma', e' \rangle)$$

We analyze several subcases.

**Subcase**  $e_1 = n_1$  **and**  $e_2 = n_2$ : By rule ADD, we immediately have  $\langle \sigma, n_1 + n_2 \rangle \rightarrow \langle \sigma, p \rangle$ , where  $p = n_1 + n_2$ .

**Subcase**  $e_1 \notin Int$ : By assumption and the definition of fvs we have

$$fvs(e_1) \subseteq fvs(e_1 + e_2) \subseteq dom(\sigma)$$

Hence, by the induction hypothesis  $P(e_1)$  we also have  $\langle \sigma, e_1 \rangle \rightarrow \langle \sigma', e' \rangle$  for some e' and  $\sigma'$ . By rule LADD we have  $\langle \sigma, e_1 + e_2 \rangle \rightarrow \langle \sigma', e' + e_2 \rangle$ .

**Subcase**  $e_1 = n_1$  and  $e_2 \notin Int$ : By assumption and the definition of fvs we have

$$fvs(e_2) \subseteq fvs(e_1 + e_2) \subseteq dom(\sigma)$$

Hence, by the induction hypothesis  $P(e_2)$  we also have  $\langle \sigma, e_2 \rangle \rightarrow \langle \sigma', e' \rangle$  for some e' and  $\sigma'$ . By rule RADD we have  $\langle \sigma, e_1 + e_2 \rangle \rightarrow \langle \sigma', e_1 + e' \rangle$ , which finishes the case.

**Case**  $e = e_1 * e_2$ : Analogous to the previous case.

**Case**  $e = x := e_1$ ;  $e_2$ : Let  $\sigma$  be an arbitrary store, and assume that  $fvs(e) \subseteq dom(\sigma)$ . As above, we assume that  $P(e_1)$  and  $P(e_2)$  hold and show that P(e) holds. Let's expand these properties. We have

$$P(e_1) = \forall \sigma. \ fvs(e_1) \subseteq dom(\sigma) \Longrightarrow e_1 \in \mathbf{Int} \ \text{or} \ (\exists e', \sigma'. \langle \sigma, e_1 \rangle \to \langle \sigma', e' \rangle)$$
  
 $P(e_2) = \forall \sigma. \ fvs(e_2) \subseteq dom(\sigma) \Longrightarrow e_2 \in \mathbf{Int} \ \text{or} \ (\exists e', \sigma'. \langle \sigma, e_2 \rangle \to \langle \sigma', e' \rangle)$ 

and want to prove:

$$P(x := e_1; e_2) = \forall \sigma. \ fvs(x := e_1; e_2) \subseteq dom(\sigma) \Longrightarrow$$
$$x := e_1; e_2 \in \mathbf{Int} \ \text{or} \ (\exists e', \sigma'. \langle \sigma, x := e_1; e_2 \rangle \to \langle \sigma', e' \rangle)$$

We analyze several subcases.

**Subcase**  $e_1 = n_1$ : By rule AssGN we have  $\langle \sigma, x := n_1 ; e_2 \rangle \rightarrow \langle \sigma', e_2 \rangle$  where  $\sigma' = \sigma[x \mapsto n_1]$ . **Subcase**  $e_1 \notin \text{Int:}$  By assumption and the definition of fvs we have

$$fvs(e_1) \subseteq fvs(x := e_1; e_2) \subseteq dom(\sigma)$$

Hence, by induction hypothesis we also have  $\langle \sigma, e_1 \rangle \to \langle \sigma', e' \rangle$  for some e' and  $\sigma'$ . By the rule AssGN1 we have  $\langle \sigma, x := e_1 ; e_2 \rangle \to \langle \sigma', x := e'_1 ; e_2 \rangle$ , which finishes the case and the inductive proof.
