

# CS 4120 / 4121 CS 5120/5121

Introduction to Compilers

Fall 2011

Andrew Myers

Lecture 1: Overview

CS 4120 Introduction to Compilers

## Outline

- About this course
- Introduction to compilers
  - What are compilers?
  - Why should we learn about them?
  - Anatomy of a compiler
- Introduction to lexical analysis
  - Text stream to tokens

CS 4120 Introduction to Compilers

2

## Course Information

- MWF 1:25- 2:15<sub>PM</sub> in Hollister 306
- Instructor: Andrew Myers
- Teaching Assistants: Wenzel Jakob, Gregor Stocks
- E-mail: [cs4120-l@cs.cornell.edu](mailto:cs4120-l@cs.cornell.edu)
- Web page:  
<http://www.cs.cornell.edu/courses/cs4120>
- Newsgroup: [cornell.class.cs4120](http://cornell.class.cs4120)

CS 4120 Introduction to Compilers

3

## 4 = 5 & 0 = 1

- CS 4120 and 5120 are really the same course
  - same lectures
  - same assignments or nearly so
  - 5120 is for MEng students, 4120 for others
- CS 4121 (5121) is required!
  - most coursework is in the project

CS 4120 Introduction to Compilers

4

## Textbooks

- Lecture notes provided; no required textbook
- On reserve in Uris Library:
  - **Compilers—Principles, Techniques and Tools.** Aho, Lam, Sethi and Ullman (The Dragon Book)  
(strength: parsing)
  - **Modern Compiler Implementation in Java.** Andrew Appel.  
(strength: translation)
  - **Advanced Compiler Design and Implementation.** Steve Muchnick.  
(strength: optimization)

## Work

- Homeworks: 4, 20% total
  - 5/5/5/5
- Programming Assignments: 7, 50%
  - 5-10% each
- Exams: 2 prelims, 30%
  - 15/15
  - No final exam

## Academic integrity

- Taken seriously.
- Do your own (or your group's) work.
- Report who you discussed homework with (whether student in class or not).

## Homeworks

- Three assignments in first half of course; one homework in second half
- **Not** done in groups—you may discuss with others but do your own work
  - Report who you discussed homework with

## Projects

- Seven programming assignments
- Implementation language: Java
  - talk to us if your group wants to use something else (e.g., OCaml)
- Groups of 3-4 students
  - same group for entire class (ordinarily)
  - same grade for all (ordinarily)
  - workload and success in this class depend on working and planning well with your group. Be a good citizen.
  - tell us **early** if you are having problems.
- End of this class: some time to form groups
  - create your group on CMS for PA1.
  - contact us if you are having trouble finding a group.

## Assignments

- Due at midnight on due date
- Late homeworks, programming assignments increasingly penalized
  - 1 day: 5%, 2 days: 15%, 3 days: 30%, 4 days: 50%
  - weekend = 1 day
  - Extensions often granted, but must be approved 2 days in advance
- Projects submitted via CMS
- Solutions available via CMS

## Why take this course?

- CS 4120 is an elective course
- Expect to learn:
  - practical applications of theory, algorithms, data structures
  - parsing
  - deeper understanding of what code is
  - how high-level languages are implemented
  - a little programming language semantics
  - Intel x86 architecture, Java
  - how programs really execute on computers
  - how to be a better programmer (esp. in groups)

## What are Compilers?

- Translators from one representation of program code to another
- Typically: high-level source code to machine language (object code)
- Not always:
  - Java compiler: Java to interpretable bytecodes
  - Java JIT: bytecode to executable image

## Source Code

- Source code: optimized for human readability
  - expressive: matches human notions of grammar
  - redundant to help avoid programming errors
  - computation possibly not fully determined by code

```
int expr(int n)
{
    int d;
    d = 4 * n * n * (n + 1) * (n + 1);
    return d;
}
```

## Machine code

- Optimized for hardware
  - Redundancy, ambiguity reduced
  - Information about intent and reasoning lost
  - Assembly code  $\approx$  machine code

```
expr:      pushl    %ebp                55
           movl    %esp, %ebp          89 e5
           subl    $4, %esp            83 ec 04
           movl    8(%ebp), %eax        8b 45 08
           movl    %eax, %edx          89 c2
           imull   8(%ebp), %edx        0f af 55 08
           movl    8(%ebp), %eax        8b 45 08
           incl    %eax                40
           imull   %eax, %edx          0f af d0
           movl    8(%ebp), %eax        8b 45 08
           incl    %eax                40
           imull   %edx, %eax          0f af c2
           sall    $2, %eax            c1 e0 02
           movl    %eax, -4(%ebp)       89 45 fc
           movl    -4(%ebp), %eax       8b 45 fc
           leave   %eax                 c9
           ret                                c3
```

## Example (Output assembly code)

### Unoptimized Code

```
expr:      pushl    %ebp
           movl    %esp, %ebp
           subl    $4, %esp
           movl    8(%ebp), %eax
           movl    %eax, %edx
           imull   8(%ebp), %edx
           movl    8(%ebp), %eax
           incl    %eax
           imull   %eax, %edx
           movl    8(%ebp), %eax
           incl    %eax
           imull   %edx, %eax
           sall    $2, %eax
           movl    %eax, -4(%ebp)
           movl    -4(%ebp), %eax
           leave   %eax
           ret
```

### Optimized Code

```
expr:      pushl    %ebp
           movl    %esp, %ebp
           movl    8(%ebp), %edx
           movl    %edx, %eax
           imull   %edx, %eax
           incl    %edx
           imull   %edx, %eax
           imull   %edx, %eax
           sall    $2, %eax
           leave   %eax
           ret
```

## How to translate?

- Source code and machine code mismatch
- Goals:
  - source-level expressiveness for task
  - best performance for concrete computation
  - reasonable translation efficiency ( $< O(n^3)$ )
  - maintainable compiler code

## How to translate correctly?

- Programming languages describe computation precisely
- Therefore: translation can be precisely described (a compiler can be correct)
- Correctness is very important!
  - hard to debug programs with broken compiler...
  - non-trivial: programming languages are expressive
  - implications for development cost, security
  - this course: techniques for building correct compilers
  - some compilers have been **proven** correct!  
[X. Leroy, Formal Certification of a Compiler Back End, POPL '06]

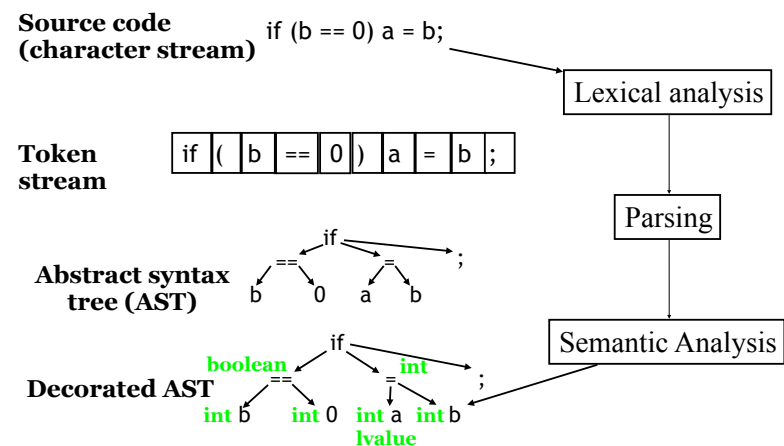

## How to translate effectively?

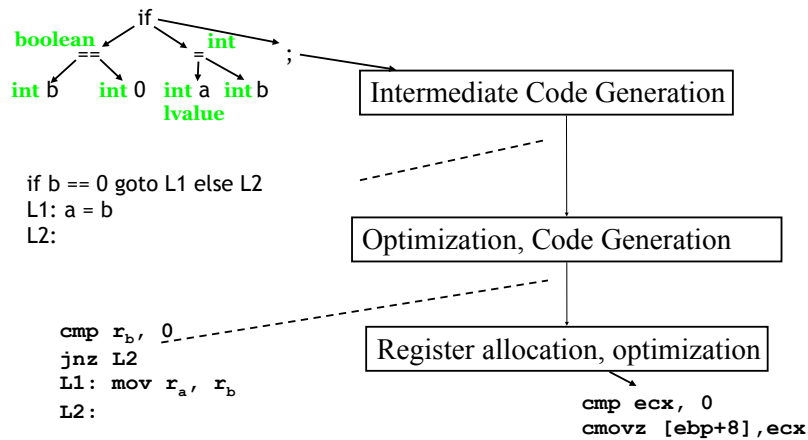

## Idea: translate in steps

- Compiler uses a series of different **program representations**.
- Intermediate representations that are good for program manipulations of various kinds (analysis, optimization, code generation).

## Compilation in a Nutshell 1

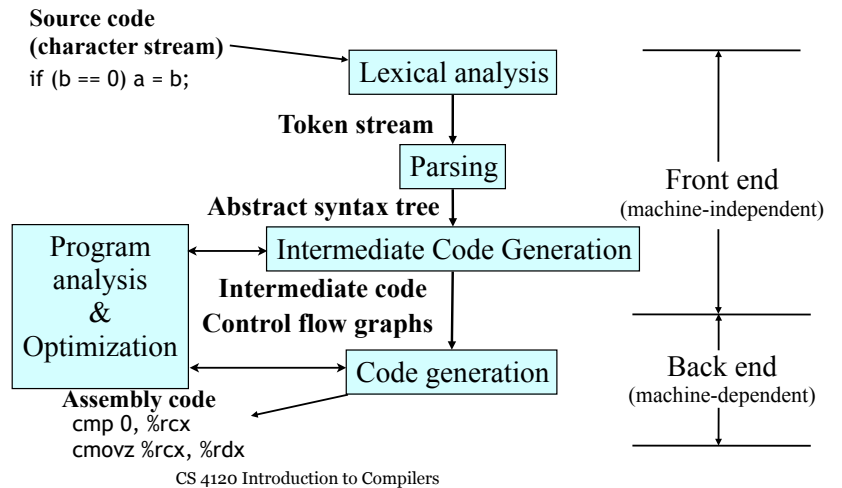

## Compilation in a Nutshell 2

CS 4120 Introduction to Compilers

21

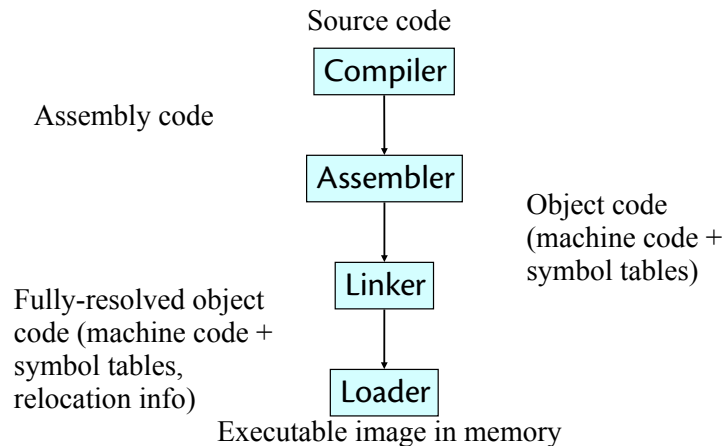

## Simplified Compiler Structure

CS 4120 Introduction to Compilers

22

## Even bigger picture

CS 4120 Introduction to Compilers

23

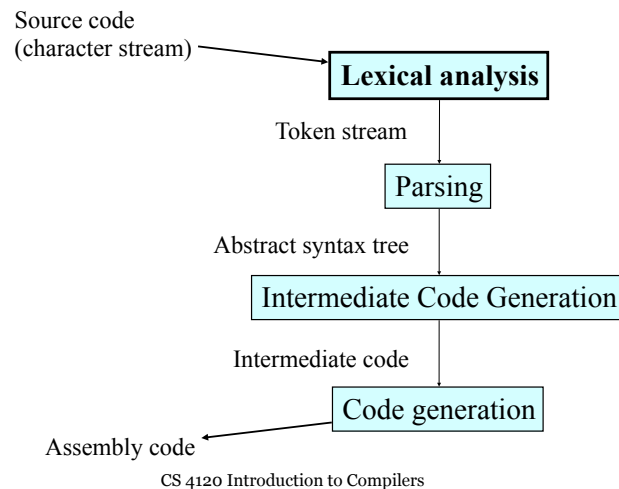

## Schedule

- Detailed schedule on web page, with links
- Lexical analysis and parsing: 6
- Semantic analysis: 5
- Intermediate code: 4
- Prelim #1
- Code generation: 3
- Separate compilation and objects: 4
- Optimization: 8
- Prelim #2
- Run-time, link-time support: 2
- Advanced topics: 7

CS 4120 Introduction to Compilers

24

# First step: Lexical Analysis

25

# What is Lexical Analysis?

- Aka tokenizing, scanning, lexing
- Converts character stream to token stream of pairs  $\langle \text{token type}, \text{attribute} \rangle$

```
if (x1 * x2 < 1.0) {
  y = x1;
}
```

i	f		(	x	1		*		x	2		<	1	.	0	)	{	\n
---	---	--	---	---	---	--	---	--	---	---	--	---	---	---	---	---	---	----

if	(	Id: x1	*	Id: x2	<	Num: 1.0	)	{	Id: y
----	---	--------	---	--------	---	----------	---	---	-------

CS 4120 Introduction to Compilers

26

# Token stream

- Gets rid of whitespace, comments
- Only  $\langle \text{Token type}, \text{attribute} \rangle$ :
  - $\langle \text{Id}, "x" \rangle$ ,  $\langle \text{Float}, 1.0e0 \rangle$
- Token location preserved for debugging, run-time/compile-time error messages (source file, line number, character posn...)
  - $\langle \text{Id}, "x", "Main.java", 542 \rangle$
- Issues:
  - how to specify tokens
  - how to implement tokenizer/lexer
