

# Relational Calculus

## Chapter 4, Part B

---

---

---

---

---

---

---

---

# Relational Calculus

- ❖ Comes in two flavors: Tuple relational calculus (TRC) and Domain relational calculus (DRC).
- ❖ Calculus has *variables, constants, comparison ops, logical connectives* and *quantifiers*.
  - TRC: Variables range over (i.e., get bound to) *tuples*.
  - DRC: Variables range over *domain elements* (= field values).
  - Both TRC and DRC are simple subsets of first-order logic.
- ❖ Expressions in the calculus are called *formulas*. An answer tuple is essentially an assignment of constants to variables that make the formula evaluate to *true*.

---

---

---

---

---

---

---

---

# Domain Relational Calculus

- ❖ *Query* has the form:  
$$\langle x_1, x_2, \dots, x_n \rangle \mid p(\langle x_1, x_2, \dots, x_n \rangle)$$
- ❖ *Answer* includes all tuples  $\langle x_1, x_2, \dots, x_n \rangle$  that make the formula  $p(\langle x_1, x_2, \dots, x_n \rangle)$  be *true*.
- ❖ Formula is recursively defined, starting with simple *atomic formulas* (getting tuples from relations or making comparisons of values), and building bigger and better formulas using the *logical connectives*.

---

---

---

---

---

---

---

---

## DRC Formulas

### ❖ Atomic formula:

- $\langle x_1, x_2, \dots, x_n \rangle \in Rname$  , or  $X \text{ op } Y$ , or  $X \text{ op } \text{constant}$
- $op$  is one of  $<, >, =, \leq, \geq, \neq$

### ❖ Formula:

- an atomic formula, or
- $\neg p, p \wedge q, p \vee q$ , where  $p$  and  $q$  are formulas, or
- $\exists X(p(X))$  , where variable  $X$  is **free** in  $p(X)$ , or
- $\forall X(p(X))$ , where variable  $X$  is **free** in  $p(X)$

### ❖ The use of **quantifiers** $\exists X$ and $\forall X$ is said to **bind** $X$ .

- A variable that is **not bound** is **free**.

---

---

---

---

---

---

---

---

## Free and Bound Variables

### ❖ The use of **quantifiers** $\exists X$ and $\forall X$ in a formula is said to **bind** $X$ .

- A variable that is **not bound** is **free**.

### ❖ Let us revisit the definition of a **query**:

$$\{ \langle x_1, x_2, \dots, x_n \rangle \mid p(\langle x_1, x_2, \dots, x_n \rangle) \}$$

### ❖ There is an important restriction: the variables **$x_1, \dots, x_n$** that appear to the left of $\mid$ must be the **only** free variables in the formula $p(\dots)$ .

---

---

---

---

---

---

---

---

## Find all sailors with a rating above 7

$$\{ \langle I, N, T, A \rangle \mid \langle I, N, T, A \rangle \in \text{Sailors} \wedge T > 7 \}$$

### ❖ The condition $\langle I, N, T, A \rangle \in \text{Sailors}$ ensures that the domain variables $I, N, T$ and $A$ are bound to fields of the same Sailors tuple.

### ❖ The term $\langle I, N, T, A \rangle$ to the left of $\mid$ (which should be read as *such that*) says that every tuple $\langle I, N, T, A \rangle$ that satisfies $T > 7$ is in the answer.

### ❖ Modify this query to answer:

- Find sailors who are older than 18 or have a rating under 9, and are called 'Joe'.

---

---

---

---

---

---

---

---

Find sailors rated  $> 7$  who have reserved boat #103

$$\{ \langle I, N, T, A \rangle \mid \langle I, N, T, A \rangle \in \text{Sailors} \wedge T > 7 \wedge \\ \exists Ir, Br, D \left( \langle Ir, Br, D \rangle \in \text{Reserves} \wedge Ir = I \wedge Br = 103 \right) \}$$

❖ We have used  $\exists Ir, Br, D (\dots)$  as a shorthand for  $\exists Ir (\exists Br (\exists D (\dots)))$

❖ Note the use of  $\exists$  to find a tuple in Reserves that 'joins with' the Sailors tuple under consideration.

---

---

---

---

---

---

---

---

Find sailors rated  $> 7$  who've reserved a red boat

$$\{ \langle I, N, T, A \rangle \mid \langle I, N, T, A \rangle \in \text{Sailors} \wedge T > 7 \wedge \\ \exists Ir, Br, D \left( \langle Ir, Br, D \rangle \in \text{Reserves} \wedge Ir = I \wedge \right. \\ \left. \exists B, BN, C \left( \langle B, BN, C \rangle \in \text{Boats} \wedge B = Br \wedge C = \text{'red'} \right) \right) \}$$

❖ Observe how the parentheses control the scope of each quantifier's binding.

❖ This may look cumbersome, but with a good user interface, it is very intuitive. (MS Access, QBE)

---

---

---

---

---

---

---

---

Find sailors who've reserved all boats

$$\{ \langle I, N, T, A \rangle \mid \langle I, N, T, A \rangle \in \text{Sailors} \wedge \\ \forall B, BN, C \left( \neg \left( \langle B, BN, C \rangle \in \text{Boats} \right) \vee \right. \\ \left. \left( \exists Ir, Br, D \left( \langle Ir, Br, D \rangle \in \text{Reserves} \wedge Ir = I \wedge Br = B \right) \right) \right) \}$$

❖ Find all sailors  $I$  such that for each 3-tuple  $\langle B, BN, C \rangle$  either it is not a tuple in Boats or there is a tuple in Reserves showing that sailor  $I$  has reserved it.

---

---

---

---

---

---

---

---

Find sailors who've reserved all boats (again!)

$$\{ \langle I, N, T, A \rangle \mid \langle I, N, T, A \rangle \in \text{Sailors} \wedge \\ \forall \langle B, BN, C \rangle \in \text{Boats} \\ ( \exists \langle Ir, Br, D \rangle \in \text{Reserves} ( I = Ir \wedge Br = B ) ) \}$$

- ❖ Simpler notation, same query. (Much clearer!)
- ❖ To find sailors who've reserved all red boats:

$$\dots \{ C \neq \text{'red'} \vee \exists \langle Ir, Br, D \rangle \in \text{Reserves} ( I = Ir \wedge Br = B ) \}$$

---

---

---

---

---

---

---

---

## Unsafe Queries, Expressive Power

- ❖ It is possible to write syntactically correct calculus queries that have an infinite number of answers! Such queries are called *unsafe*.

- e.g.,  $\{ S \mid \neg (S \in \text{Sailors}) \}$

- ❖ It is known that every query that can be expressed in relational algebra can be expressed as a safe query in DRC / TRC; the converse is also true.

- ❖ **Relational Completeness:** Query language (e.g., SQL) can express every query that is expressible in relational algebra/calculus.

---

---

---

---

---

---

---

---

## Summary

- ❖ Relational calculus is non-operational, and users define queries in terms of what they want, not in terms of how to compute it. (Declarativeness.)
- ❖ Algebra and safe calculus have same expressive power, leading to the notion of relational completeness.
