

Spline Curves

CS 465 Lecture 10

Motivation: smoothness

- In many applications we need smooth shapes
 - that is, without discontinuities

- So far we can make
 - things with corners (lines, squares, rectangles, ...)
 - circles and ellipses (only get you so far!)

Classical approach

- Pencil-and-paper draftsmen also needed smooth curves
- Origin of “spline:” strip of flexible metal
 - held in place by pegs or weights to constrain shape
 - traced to produce smooth contour

Translating into usable math

- Smoothness
 - in drafting spline, comes from physical curvature minimization
 - in CG spline, comes from choosing smooth functions
 - usually low-order polynomials
- Control
 - in drafting spline, comes from fixed pegs
 - in CG spline, comes from user-specified *control points*

Defining spline curves

- At the most general they are parametric curves

$$S = \{\mathbf{p}(t) \mid t \in [0, N]\}$$

- Generally $f(t)$ is a piecewise polynomial
 - for this lecture, the discontinuities are at the integers

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 5

Defining spline curves

- Generally $f(t)$ is a piecewise polynomial
 - for this lecture, the discontinuities are at the integers
 - e.g., a cubic spline has the following form over $[k, k + 1]$:

$$x(t) = a_x t^3 + b_x t^2 + c_x t + d_x$$

$$y(t) = a_y t^3 + b_y t^2 + c_y t + d_y$$

- Coefficients are different for every interval

© 2007 Doug James • 8

Control of spline curves

- Specified by a sequence of **control points**
- Shape is guided by control points (aka control polygon)
 - interpolating**: passes through points
 - approximating**: merely guided by points

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 9

How splines depend on their controls

- Each coordinate is separate
 - the function $x(t)$ is determined solely by the x coordinates of the control points
 - this means 1D, 2D, 3D, ... curves are all really the same
- Spline curves are **linear** functions of their controls
 - moving a control point two inches to the right moves $x(t)$ twice as far as moving it by one inch
 - $x(t)$, for fixed t , is a linear combination (weighted sum) of the control points' x coordinates
 - $p(t)$, for fixed t , is a linear combination (weighted sum) of the control points

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 10

Splines as reconstruction

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 11

Trivial example: piecewise linear

- This spline is just a polyline
 - control points are the vertices
- But we can derive it anyway as an illustration
- Each interval will be a linear function
 - $x(t) = at + b$
 - constraints are values at endpoints
 - $b = x_0$; $a = x_1 - x_0$
 - this is linear interpolation

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 12

Trivial example: piecewise linear

- Vector formulation

$$x(t) = (x_1 - x_0)t + x_0$$

$$y(t) = (y_1 - y_0)t + y_0$$

$$\mathbf{p}(t) = (\mathbf{p}_1 - \mathbf{p}_0)t + \mathbf{p}_0$$

- Matrix formulation

$$\mathbf{p}(t) = \begin{bmatrix} t & 1 \end{bmatrix} \begin{bmatrix} -1 & 1 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} \mathbf{p}_0 \\ \mathbf{p}_1 \end{bmatrix}$$

Trivial example: piecewise linear

- Basis function formulation

- regroup expression by \mathbf{p} rather than t

$$\begin{aligned} \mathbf{p}(t) &= (\mathbf{p}_1 - \mathbf{p}_0)t + \mathbf{p}_0 \\ &= (1 - t)\mathbf{p}_0 + t\mathbf{p}_1 \end{aligned}$$

- interpretation in matrix viewpoint

$$\mathbf{p}(t) = \left(\begin{bmatrix} t & 1 \end{bmatrix} \begin{bmatrix} -1 & 1 \\ 1 & 0 \end{bmatrix} \right) \begin{bmatrix} \mathbf{p}_0 \\ \mathbf{p}_1 \end{bmatrix}$$

Trivial example: piecewise linear

- Vector blending formulation: “average of points”
 - blending functions: contribution of each control point as t changes

Trivial example: piecewise linear

- Basis function formulation: “function times point”
 - basis functions: contribution of each point as t changes

- can think of them as blending functions glued together
- (this is just like a reconstruction filter!)

Seeing the basis functions

- Basis functions of a spline are revealed by how the curve changes in response to a change in one control
 - to get a graph of the basis function, start with the curve laid out in a straight, constant-speed line
 - what are $x(t)$ and $y(t)$?
 - then move one control straight up

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 17

Hermite splines

- Less trivial example
- Form of curve: piecewise cubic
- Constraints: endpoints and tangents (derivatives)

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 18

Hermite splines

- Solve constraints to find coefficients

$$x(t) = at^3 + bt^2 + ct + d$$

$$x'(t) = 3at^2 + 2bt + c$$

$$x(0) = x_0 = d$$

$$x(1) = x_1 = a + b + c + d$$

$$x'(0) = x'_0 = c$$

$$x'(1) = x'_1 = 3a + 2b + c$$

$$d = x_0$$

$$c = x'_0$$

$$a = 2x_0 - 2x_1 + x'_0 + x'_1$$

$$b = -3x_0 + 3x_1 - 2x'_0 - x'_1$$

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 19

Hermite splines

- **Preview:** Matrix form is much simpler

$$\mathbf{p}(t) = \begin{bmatrix} t^3 & t^2 & t & 1 \end{bmatrix} \begin{bmatrix} 2 & -2 & 1 & 1 \\ -3 & 3 & -2 & -1 \\ 0 & 0 & 1 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \mathbf{p}_0 \\ \mathbf{p}_1 \\ \mathbf{v}_0 \\ \mathbf{v}_1 \end{bmatrix}$$

– coefficients = rows

– basis functions = columns

- note \mathbf{p} columns sum to $[0 \ 0 \ 0 \ 1]^T$

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 20

Longer Hermite splines

- Can only do so much with one Hermite spline
- Can use these splines as segments of a longer curve
 - curve from $t = 0$ to $t = 1$ defined by first segment
 - curve from $t = 1$ to $t = 2$ defined by second segment
- To avoid discontinuity, match derivatives at junctions
 - this produces a C^1 curve

Continuity

- Smoothness can be described by degree of continuity
 - zero-order (C^0): position matches from both sides
 - first-order (C^1): tangent matches from both sides
 - second-order (C^2): curvature matches from both sides
 - G^n vs. C^n

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 24

Continuity

- **Parametric continuity (C):**
 - Continuity of the coordinate functions
- **Geometric continuity (G):**
 - Continuity of the curve itself
- Neither form of continuity guarantees the other:
 - Can be C^1 but not G^1 when $\mathbf{p}(t)$ comes to a halt (next slide)
 - Can be G^1 but not C^1 when the tangent vector changes length abruptly

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 25

Geometric vs. parametric continuity

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 26

Control

- Local control
 - changing control point only affects a limited part of spline
 - without this, splines are very difficult to use
 - many likely formulations lack this
 - natural spline
 - polynomial fits

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 27

Control

- Convex hull property
 - convex hull = smallest convex region containing points
 - think of a rubber band around some pins
 - some splines stay inside convex hull of control points
 - make clipping, culling, picking, etc. simpler

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 28

Affine invariance

- Transforming the control points is the same as transforming the curve
 - true for all commonly used splines
 - extremely convenient in practice...

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 29

Matrix form of spline

$$\mathbf{p}(t) = \mathbf{a}t^3 + \mathbf{b}t^2 + \mathbf{c}t + \mathbf{d}$$

$$\begin{bmatrix} t^3 & t^2 & t & 1 \end{bmatrix} \begin{bmatrix} \times & \times & \times & \times \\ \times & \times & \times & \times \\ \times & \times & \times & \times \\ \times & \times & \times & \times \end{bmatrix} \begin{bmatrix} \mathbf{p}_0 \\ \mathbf{p}_1 \\ \mathbf{p}_2 \\ \mathbf{p}_3 \end{bmatrix}$$

$$\mathbf{p}(t) = b_0(t)\mathbf{p}_0 + b_1(t)\mathbf{p}_1 + b_2(t)\mathbf{p}_2 + b_3(t)\mathbf{p}_3$$

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 30

Hermite splines

- Constraints are endpoints and endpoint tangents

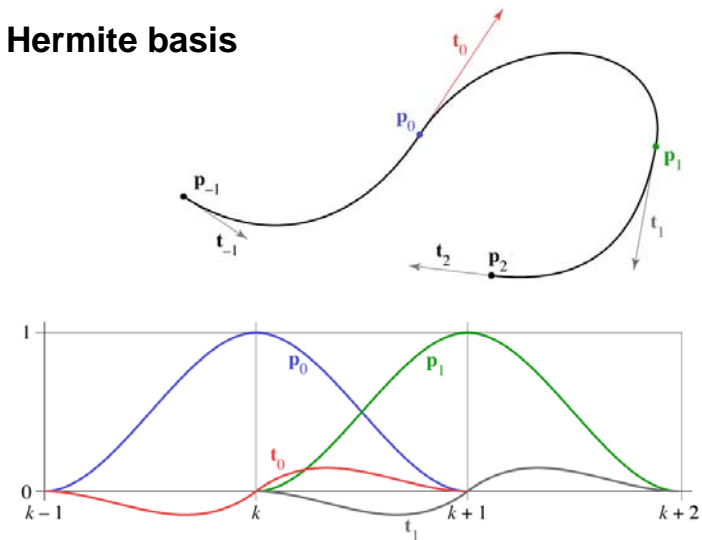

$$\mathbf{p}(t) = \begin{bmatrix} t^3 & t^2 & t & 1 \end{bmatrix} \begin{bmatrix} 2 & -2 & 1 & 1 \\ -3 & 3 & -2 & -1 \\ 0 & 0 & 1 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \mathbf{p}_0 \\ \mathbf{p}_1 \\ \mathbf{v}_0 \\ \mathbf{v}_1 \end{bmatrix}$$

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 31

Hermite basis

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 32

Affine invariance

- Basis functions associated with points should always sum to 1

$$\begin{aligned} \mathbf{p}(t) &= b_0 \mathbf{p}_0 + b_1 \mathbf{p}_1 + b_2 \mathbf{v}_0 + b_3 \mathbf{v}_1 \\ \mathbf{p}'(t) &= b_0(\mathbf{p}_0 + \mathbf{u}) + b_1(\mathbf{p}_1 + \mathbf{u}) + b_2 \mathbf{v}_0 + b_3 \mathbf{v}_1 \\ &= b_0 \mathbf{p}_0 + b_1 \mathbf{p}_1 + b_2 \mathbf{v}_0 + b_3 \mathbf{v}_1 + (b_0 + b_1) \mathbf{u} \\ &= \mathbf{p}(t) + \mathbf{u} \end{aligned}$$

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 33

Hermite to Bézier

- Mixture of points and vectors is awkward
- Specify tangents as differences of points

- Note: derivative is defined as 3 times offset
- reason is illustrated by linear case

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 34

Hermite to Bézier

$$\begin{aligned} \mathbf{p}_0 &= \mathbf{q}_0 \\ \mathbf{p}_1 &= \mathbf{q}_3 \\ \mathbf{v}_0 &= 3(\mathbf{q}_1 - \mathbf{q}_0) \\ \mathbf{v}_1 &= 3(\mathbf{q}_3 - \mathbf{q}_2) \end{aligned}$$

$$\begin{bmatrix} \mathbf{a} \\ \mathbf{b} \\ \mathbf{c} \\ \mathbf{d} \end{bmatrix} = \begin{bmatrix} -1 & 3 & -3 & 1 \\ 3 & -6 & 3 & 0 \\ -3 & 3 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \mathbf{q}_0 \\ \mathbf{q}_1 \\ \mathbf{q}_2 \\ \mathbf{q}_3 \end{bmatrix}$$

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 35

Bézier matrix

$$\mathbf{p}(t) = \begin{bmatrix} t^3 & t^2 & t & 1 \end{bmatrix} \begin{bmatrix} -1 & 3 & -3 & 1 \\ 3 & -6 & 3 & 0 \\ -3 & 3 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \mathbf{p}_0 \\ \mathbf{p}_1 \\ \mathbf{p}_2 \\ \mathbf{p}_3 \end{bmatrix}$$

- note that these are the Bernstein polynomials

$$C(n, k) t^k (1 - t)^{n-k}$$

and that defines Bézier curves for any degree.

- C(n,k): Binomial coefficient ${}_n C_k = \binom{n}{k} = \frac{n!}{(n-k)! k!}$

© 2007 Doug James • 36

Bézier basis

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 37

Convex hull

- If basis functions are all positive, the spline has the convex hull property
 - we're still requiring them to sum to 1

- if any basis function is ever negative, no convex hull property!
 - proof: take the other three points at the same place

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 38

Chaining spline segments

- Hermite curves are convenient because they can be made long easily
- Bézier curves are convenient because their controls are all points and they have nice properties
 - and they interpolate every 4th point, which is a little odd
- We derived Bézier from Hermite by defining tangents from control points
 - a similar construction leads to the interpolating *Catmull-Rom* spline

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 39

Chaining Bézier splines

- No continuity built in
- Achieve C^1 using collinear control points

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 40

Subdivision

- A Bézier spline segment can be split into a two-segment curve:

- de Casteljau's algorithm (fast, numerically stable)
- also works for arbitrary t

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 41

Cubic Bézier splines

- Very widely used type, especially in 2D
 - e.g. it is a primitive in PostScript/PDF
- Can represent C^1 and/or G^1 curves with corners
- Can easily add points at any position
- Illustrator demo

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 42

Hermite to Catmull-Rom

- Have not yet seen any interpolating splines
- Would like to define tangents automatically
 - use adjacent control points

- end tangents: extra points or zero

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 43

Hermite to Catmull-Rom

- Tangents are $(\mathbf{q}_{k+1} - \mathbf{q}_{k-1}) / 2$
 - scaling based on same argument about collinear case

$$\mathbf{p}_0 = \mathbf{q}_k$$

$$\mathbf{p}_1 = \mathbf{q}_{k+1}$$

$$\mathbf{v}_0 = 0.5(\mathbf{q}_{k+1} - \mathbf{q}_{k-1})$$

$$\mathbf{v}_1 = 0.5(\mathbf{q}_{k+2} - \mathbf{q}_k)$$

$$\begin{bmatrix} \mathbf{a} \\ \mathbf{b} \\ \mathbf{c} \\ \mathbf{d} \end{bmatrix} = \begin{bmatrix} 2 & -2 & 1 & 1 \\ -3 & 3 & -2 & -1 \\ 0 & 0 & 1 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -.5 & 0 & .5 & 0 \\ 0 & -.5 & 0 & .5 \end{bmatrix} \begin{bmatrix} \mathbf{q}_{k-1} \\ \mathbf{q}_k \\ \mathbf{q}_{k+1} \\ \mathbf{q}_{k+2} \end{bmatrix}$$

Catmull-Rom splines

- Our first example of an *interpolating spline*
- Like Bézier, equivalent to Hermite
 - in fact, all splines of this cubic form are equivalent
- First example of a spline based on just a control point sequence
- Does not have convex hull property
- Only C^1

B-splines

- We may want more continuity than C^1
- We may not need an interpolating spline
- B-splines are a clean, flexible way of making long splines with arbitrary order of continuity
- Various ways to think of construction
 - a simple one is convolution
 - relationship to sampling and reconstruction

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 48

Cubic B-spline basis

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 49

Deriving the B-Spline

- Approached from a different tack than Hermite-style constraints
 - Want a cubic spline; therefore 4 active control points
 - Want C^2 continuity
 - Turns out that is enough to determine everything

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 50

Efficient construction of any B-spline

- B-splines defined for all orders
 - order d : degree $d-1$
 - order d : d points contribute to value
- One definition: Cox-deBoor recurrence

$$b_1 = \begin{cases} 1 & 0 \leq u < 1 \\ 0 & \text{otherwise} \end{cases}$$

$$b_d = \frac{t}{d-1} b_{d-1}(t) + \frac{d-t}{d-1} b_{d-1}(t-1)$$

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 51

B-spline construction, alternate view

- Recurrence
 - ramp up/down
- Convolution
 - smoothing of basis fn
 - smoothing of curve

Cornell CS465 Fall 2007 • Lecture 10

© 2007 Doug James • 52

Cubic B-spline matrix

$$\mathbf{p}(t) = \begin{bmatrix} t^3 & t^2 & t & 1 \end{bmatrix} \cdot \frac{1}{6} \begin{bmatrix} -1 & 3 & -3 & 1 \\ 3 & -6 & 3 & 0 \\ -3 & 0 & 3 & 0 \\ 1 & 4 & 1 & 0 \end{bmatrix} \begin{bmatrix} \mathbf{p}_{k-1} \\ \mathbf{p}_k \\ \mathbf{p}_{k+1} \\ \mathbf{p}_{k+2} \end{bmatrix}$$

Other types of B-splines

- Nonuniform B-splines
 - discontinuities not evenly spaced
 - allows control over continuity or interpolation at certain points
 - e.g., interpolate endpoints (commonly used case)
- Nonuniform Rational B-splines (NURBS)
 - ratios of nonuniform B-splines: $x(t) / w(t)$; $y(t) / w(t)$
 - key properties:
 - invariance under perspective as well as affine
 - ability to represent conic sections exactly

Converting spline representations

- All the splines we have seen so far are equivalent
 - all represented by geometry matrices

$$\mathbf{p}_S(t) = T(t)M_S P_S$$

- where S represents the type of spline
 - therefore the control points may be transformed from one type to another using matrix multiplication

$$P_1 = M_1^{-1} M_2 P_2$$

$$\begin{aligned} \mathbf{p}_1(t) &= T(t)M_1(M_1^{-1}M_2P_2) \\ &= T(t)M_2P_2 = \mathbf{p}_2(t) \end{aligned}$$

Evaluating splines for display

- Need to generate a list of line segments to draw
 - generate efficiently
 - use as few as possible
 - guarantee approximation accuracy
- Approaches
 - recursive subdivision (easy to do adaptively)
 - uniform sampling (easy to do efficiently)

Evaluating by subdivision

- Recursively split spline
 - stop when polygon is within epsilon of curve
- Termination criteria
 - distance between control points
 - distance of control points from line

Evaluating with uniform spacing

- Forward differencing
 - efficiently generate points for uniformly spaced t values
 - evaluate polynomials using repeated differences
 - Problem: errors can accumulate
