

Matrix Computations, 2nd Edition
Golub and Van Loan
Table of Contents

1. Matrix Multiplication Problems	1
1.1 Basic Algorithms and Notations	2
1.2 Exploiting Structure	16
1.3 Block Matrices and Algorithms	25
1.4 Aspects of Vector Pipeline Computing	35
2. Matrix Analysis	49
2.1 Basic Ideas from Linear Algebra	49
2.2 Vector Norms	53
2.3 Matrix Norms	55
2.4 Finite Precision Matrix Computations	60
2.5 Orthogonality and the SVD	70
2.6 Projections and the CS Decomposition	75
2.7 The Sensitivity of Square Linear Systems	79
3. General Linear Systems	86
3.1 Triangular Systems	86
3.2 Computing the LU Factorization	92
3.3 Roundoff Analysis of Gaussian Elimination	104
3.4 Pivoting	108
3.5 Improving and Estimating Accuracy	123
4. Special Linear Systems	133
4.1 The LDM ^T and LDL ^T Factorizations	134
4.2 Positive Definite Systems	139
4.3 Banded Systems	149
4.4 Symmetric Indefinite Systems	159
4.5 Block Tridiagonal Systems	170
4.6 Vandermonde Systems	178
4.7 Toeplitz Systems	183

5. Orthogonalization and Least Squares	193
5.1 Householder and Givens Transformations	194
5.2 The QR Factorization	211
5.3 The Full Rank Least Squares Problem	221
5.4 Other Orthogonal Factorizations	233
5.5 The Rank Deficient Least Squares Problem	241
5.6 Weighting and Iterative Improvement	250
5.7 A Note on Square and Underdetermined Systems	256
6. Parallel Matrix Computations	260
6.1 Distributed Memory Gaxpy	261
6.2 Shared Memory Gaxpy	276
6.3 Parallel Matrix Multiplication	288
6.4 Ring Factorization Procedures	301
6.5 Mesh Factorization Procedures	310
6.6 Shared Memory Factorization Methods	321
7. The Unsymmetric Eigenvalue Problem	331
7.1 Properties and Decompositions	332
7.2 Perturbation Theory	341
7.3 Power Iterations	351
7.4 Hessenberg and Real Schur Forms	361
7.5 The Practical QR Algorithm	373
7.6 Invariant Subspace Computations	382
7.7 The QZ Algorithm for $Ax = \mu Bx$	394
8. The Symmetric Eigenvalue Problem	409
8.1 Properties, Decompositions, Perturbation Theory	410
8.2 The Symmetric QR Algorithm	418
8.3 Computing the SVD	427
8.4 Some Special Methods	437
8.5 Jacobi Methods	444
8.6 A Divide and Conquer Method	459
8.7 More Generalized Eigenvalue Problems	466

9. Lanczos Methods	475
9.1 Derivation and Convergence Properties	476
9.2 Practical Lanczos Procedures	484
9.3 Applications and Extensions	494
10. Iterative Methods for Linear Systems	505
10.1 The Standard Iterations	506
10.2 The Conjugate Gradient Methods	516
10.3 Preconditioned Conjugate Gradient Methods	527
11. Functions of Matrices	539
11.1 Eigenvalue Methods	540
11.2 Approximation Methods	546
11.3 The Matrix Exponential	555
12. Special Topics	561
12.1 Some Constrained Least Squares Problems	561
12.2 Subset Selection Using the SVD	571
12.3 Total Least Squares	576
12.4 Comparing Subspaces Using the SVD	581
12.5 Some Modified Eigenvalue Problems	587
12.6 Updating the QR Factorization	592
